Displays the timer for monitoring the motor temperature for motor temperature model 3. This timer is started when the temperature alarm threshold (p5390) is exceeded. If the timer has expired and the alarm threshold has, in the meantime, not been fallen below, then fault F07011 is output. If the temperature fault threshold (p5391) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output.

Description:

Sets the signal source to inhibit current reduction for thermal overload (p0610 = 1).

BI: p5388 = 1 signal:

Current reduction is inhibited.

BI: p5388 = 0 signal:

Current reduction is enabled.

Dependency:

This parameter is only active for p0610 = 1 (messages, reducing I_{max}).

Dependency:	Refer to: p1821, p6277			
Notice:	When changing the direction of rotation of the main machine using p1821, it must be checked as to whether the phase sequence of the exciter converter must also be changed.			
Note:	The amount of the value entered in the parameter is dynamically limited to the rated speed of the motor. The value 0 is not permissible. The sign of the hysteresis defines the rotating field of the stator current for the reverse field exciter depending on the mechanical direction of rotation. The hysteresis is symmetrical around the value in parameter p6277.

Description:	Setting to parameterize the recorder. The recorder supplies up to 64 internal variables (depending on the parameterization). The maximum recording time is 2000 ms. The variables are acquired in the current controller sampling time – and a pretrigger can be set. The values can then be acyclically written to the memory card. The development and system test departments have the software necessary to decode the content.		
Index:	[0] = Enable [1] = Recording time [2] = Pre-trigger time [3] = Output message [4] = Recording factor		
Dependency:	Refer to: A49998		
Note:	For index [0]: Enables or disables the function. p6999[0] = 0 Inhibits the function. p6999[0] = 1 Enables the function. For index [1]: Sets the recording time, [ms]. A maximum of 8000 measuring points can be recorded across all drive objects. 1 measuring point is created in one current controller sampling time. Example: The "Recorder" function module is activated on 4 drive objects. The current controller sampling time (p0115[0]) is 250 µs. --> every drive object can record a maximum of 8000/4 = 2000 measuring points. --> the recording time that can be realized is 2000 * 0.250 ms = 500 ms. Note: - the recording time that can be realized is displayed in r6991[1]. - if the recording time is set too long, then it is automatically reduced to what can be realized.		

2 Parameters

2.2 List of parameters

For index [2]:

Sets the pretrigger time, [ms].

This time is included in the recording time and cannot be longer than the recording time p6999[1].

Note:

- when the recording time is automatically reduced, the pretrigger time is correspondingly reduced as well.

- the pretrigger time that can be realized is displayed in r6991[2].

For index [3]:

Enables or disables the output of message A49998 when the trigger event is triggered.

For index [4]:

p6999[4] = n, n = 0 ... 4

Recording with the factor, which extends the record time p6999[1] and the pre-trigger time p6999[2] 2ⁿ times, and reduces the number of signals 2ⁿ times.

Example:

Number of drive objects = 1, p0115[0] = 250 μs, p6999[1] = 2000, p6999[2] = 1000, p6999[4] = 4

--> recording time: 2000 ms * 2⁴ = 32 s, pre-trigger time: 1000 ms * 2⁴ = 16 s, number of signals 64/16 = 4.

When setting p6999[4] to 0, the results are as follows:

--> recording time: 2000 ms, pre-trigger time: 1000 ms, number of signals: 64

Dependency:	Refer to: r7000			
Caution:	For a parallel connection, the following applies:			
	When deactivating individual power units using this parameter, it is not permissible that the power units of the parallel connection involved are connected. Infeed units should be disconnected from the line supply (for example, using a contactor). Motor feeder cables should be disconnected. In addition, defective power units should be disconnected from the DC link.			
Note:	For motors with separate winding systems (p7003 = 1) it is not possible to inhibit an individual power unit. p7001 is automatically reset if a power unit is deactivated via p0125 or p0895.

Description:	Specifies the motor winding system when power units are connected in parallel.		
Value:	0: One-winding system 1: Several separate winding systems or motors 2: Two separate offset winding systems		
Dependency:	For p7003 = 2: In order to permit separate, offset winding systems, wobulation must first be deactivated (p1810.2 = 0). The magnitude and direction of the offset is parameterized in p6397. When exiting commissioning, the circulating current control is automatically deactivated (p7035 = 0), and the compensation of the valve interlocking times is replaced by the appropriate stator resistance adaptation (p1780.7 = 1). Refer to: p1802, p6397		
Notice:	If, for motors with multi-winding system, the individual winding is connected with several partial inverters, then a development system (p7003 = 0) must be parameterized. The cable resistance should be entered in p0352 - and then the motor data identification performed with configuration p1909.20 = 1 (estimate cable resistance).		
Note:	For p7003 = 0: - the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352. - the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1). - individual Motor Modules can be activated and deactivated (p7001). For p7003 = 1, 2: - the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352). - all Motor Modules are activated. It is not possible to deactivate a Motor Module.

Dependency:	Refer to: p7761, p7765, p7766, p7767, p7768				
Note:	KHP: Know-How Protection				
	For bit 00: Write protection can be activated/deactivated via p7761 on the Control Unit.				
	For bit 01: The know-how protection can be activated by entering a password (p7766 ... p7768).				
	For bit 02: If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.				
	For bit 03: Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.				
	For bit 04: When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.				
	For bit 05: When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.				
	For bit 06: When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.				
	For bit 12: Together with p7755, the bit is used to monitor write protection. Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1). Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

	12	Reserved, Siemens-internal	Yes	No	-

Dependency: Refer to: p7761, p7765, p7766, p7767, p7768

Note: KHP: Know-How Protection

For bit 00:

Write protection can be activated/deactivated via p7761 on the Control Unit.

For bit 01:

The know-how protection can be activated by entering a password (p7766 ... p7768).

For bit 02:

If it has already been activated, know-how protection can be temporarily deactivated by entering the valid password in p7766. In this case, bit 1 = 0 and bit 2 = 1 offset.

For bit 03:

Know-how protection cannot be deactivated, as p7766 is not entered in the OEM exception list (only the factory setting is possible). This bit is only set if know-how protection is active (bit 1 = 1) and p7766 has not been entered in the OEM exception list.

For bit 04:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards/Control Units. This bit is only set if know-how protection is active and in p7765.0 is set = 1.

For bit 05:

When know-how protection has been activated, the contents of the memory card (parameter and DCC data) can be additionally protected against being used with other memory cards. This bit is only set if know-how protection is active and p7765.1 is set = 1 and p7765.0 is set = 0.

For bit 06:

When know-how protection is activated, the drive data can be traced using the device trace function. This bit is only set if know-how protection is active and p7765.2 is set = 1.

For bit 12:

Together with p7755, the bit is used to monitor write protection.

Bit = 1, if p7755 is not equal to 0 and write protection is active (r7760.0 = 1).

Bit = 0, if write protection was deactivated. p7755 is set to 0, and when write protection is activated again, bit 12 remains at 0.

Description: Configuration settings for know-how protection.
For bit 00, 01:
When KHP is activated, this means that the OEM can define whether the parameters and DCC data encrypted on the memory card should be protected before using on other memory cards/Control Units.
For bit 02:
This means that the OEM can define whether it is possible or not to trace the drive data using the device trace function although KHP is activated.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Extended copy protection - linked to the memory card and CU	Yes	No	-
	01	Basic copy protection - linked to the memory card	Yes	No	-
	02	Permit trace and measuring functions for diagnostic purposes	Yes	No	-

Dependency: Refer to: p7766, p7767, p7768

Note: KHP: Know-How Protection
For copy protection, the serial numbers of the memory card and/or Control Unit are checked.
The memory card copy protection and preventing data to be traced are only effective when the know-how protection has been activated.
For bit 00, 01:
If both bits are inadvertently set to 1 (e.g. at the BOP), then the setting of bit 0 applies.
There is no copy protection if both bits are set to 0.

Description:	Sets the password for know-how protection. Example of a password: 123aBc = 49 50 51 97 66 99 dec (ASCII characters) [0] = character 1 (e.g. 49 dec) [1] = character 2 (e.g. 50 dec) ... [5] = character 6 (e.g. 99 dec) [29] = 0 dec (completes the entry)		
Dependency:	Refer to: p7767, p7768		
Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. When using the STARTER commissioning tool, the password should be entered using the associated dialogs. The following rules apply when entering the password: - password entry must start with p7766[0]. - no gaps are permissible in the password. - entering a password is completed when writing to p7766[29] (p7766[29] = 0 for passwords less than 30 characters).		
Note:	KHP: Know-How Protection When reading, p7766[0...29] = 42 dec (ASCII character = "***") is displayed. Parameters with the "KHP_WRITE_NO_LOCK" attribute are not involved in the know-how protection. Parameters with the "KHP_ACTIVE_READ" attribute can be read even when know-how protection is activated. A product-specific list of these parameters is also available in the corresponding List Manual.

Description:	Sets the reference serial number for the memory card. Using this parameter, if a Control Unit and/or a memory card is replaced at the end customer, the OEM can again adapt the project to the modified hardware.		
Dependency:	Refer to: p7765, p7766, p7767, p7768		
Note:	KHP: Know-How Protection - the OEM may only change this parameter for the use case "Sending encrypted SINAMICS data". - SINAMICS only evaluates this parameter when powering up from the encrypted "Load into file system..." output or when powering up from the encrypted PS files. The evaluation is only made when know-how protection and memory card copy protection have been activated.

Description:	Sets the action to be executed for NVRAM data. At the end of the action the value is automatically set to 0.		
Value:	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset		
Notice:	After action p7770 = 1 no more pulses may be enabled. After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.		
Note:	If value = 1: This action loads the NVRAM data to the parameters. If value = 2: This action loads the parameters to the NVRAM. If value = 3: This action sets parameters p7771 ... p7774 to the factory setting. It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

Description:	Setting to backup/import/delete NVRAM data. NVRAM data are non-volatile data in the device (e.g. fault buffer). For NVRAM data actions, the following data are excluded: - crash diagnostics - CU operating hours counter		

2 Parameters

2.2 List of parameters

	- CU temperature
	- safety logbook
Value:	0: Inactive
	1: NVRAM data backup to memory card
	2: Import NVRAM data from the memory card
	3: Delete NVRAM data in the device
	10: Error when clearing
	11: Error when backing up, memory card not available
	12: Error when backing up, insufficient memory space
	13: Error when backing up
	14: Error when importing, memory card not available
	15: Error when importing, checksum error
	16: Error when importing, no NVRAM data available
	17: Error when importing

Notice: For value = 2, 3:
These actions are only possible when pulses are inhibited.

Note: After the action has been successfully completed, the parameter is automatically set to zero.
The actions importing and deleting NVRAM data immediately initiate a warm restart.
If the procedure was not successfully completed, then an appropriate fault value is displayed (p7775 >= 10).

Description: Service parameter to internally document repairs.
After a component has been replaced, this must be confirmed using p7786[PDS].x = 0/1. The "Generate report" function is then automatically executed.
After the procedure has been completed, p7786[PDS] is automatically set = 0.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Control Interface Module (CIM) replaced	Yes	No	-

Notice: The write process can take several minutes (p7786[PDS].x = 1). It is not permissible that the device is switched off during the procedure (only when p7786 = 0).

Note: The power unit involved can be assigned the correct P index using p0124 (power unit detection via LED).

Description: Sets the tolerance window for the sign of life monitoring for communication to the power unit.

Dependency: Refer to: A30853

Note: An active window is generated by means of DRIVE-CLiQ telegrams.
If more than one sign-of-life error appears in the window, then A30853 is output.
The lower the value in p7788, the greater the monitoring tolerance.

Description:

Displays the actual serial number of the memory card.
The individual characters of the serial number are displayed in the ASCII code in the indices.

Dependency:

Refer to: p9920, p9921

Notice:

An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.

Note:

Example: displaying the serial number for a memory card:

r7843[0] = 49 dec --> ASCII characters = "1" --> serial number, character 1
r7843[1] = 49 dec --> ASCII characters = "1" --> serial number, character 2
r7843[2] = 49 dec --> ASCII characters = "1" --> serial number, character 3
r7843[3] = 57 dec --> ASCII characters = "9" --> serial number, character 4
r7843[4] = 50 dec --> ASCII characters = "2" --> serial number, character 5
r7843[5] = 51 dec --> ASCII characters = "3" --> serial number, character 6
r7843[6] = 69 dec --> ASCII characters = "E" --> serial number, character 7
r7843[7] = 0 dec --> ASCII characters = " " --> serial number, character 8

...

r7843[19] = 0 dec --> ASCII characters = " " --> serial number, character 20

r7843[20] = 0 dec

Serial number = 111923E

r7844[0...3] Memory card/device memory firmware version / Mem_crd/dev_mem FW			
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: -	Calculated: -	Access level: 1

Description:	Displays the version of the firmware stored on the memory medium of the converter. Depending on the converter being used, the memory medium is a memory card (e.g. SINAMICS S120) - or the internal, non-volatile device memory (e.g. SINAMICS G120).		
Index:	[0] = Internal [1] = External [2] = Parameter backup [3] = Motor data addon		
Note:	For index [0]: Displays the internal firmware version (e.g. 04402315). This firmware version is the version of the memory card/device memory and not the CU firmware (r0018), however, normally they have the same versions. For index [1]: Displays the external firmware version (e.g. 04040000 -> 4.4). For automation systems with SINAMICS Integrated this is the runtime version of the automation system. For index [2]: Displays the internal firmware version of the parameter backup. With this CU firmware version, the parameter backup was saved, which was used when powering up. For index [3]: Displays the subsequently loaded motor database version. If there is no motor data available, then a value of 0 is shown here.

Description:	Displays the number of indices for r7853[0...n]. This corresponds to the number of DRIVE-CLiQ components that are in the target topology.		
Dependency:	Refer to: r7853		
Note:	The values are valid if all available Control Units adopt the "Initialization finished" state (r3988 = 800) following power up.

Description:	Sets the global and unique component number in a drive system with several Control Units. Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit. The indices are allocated to the global component numbers as follows: p7859[0]: Not used p7859[1]: Sets the global component number for the local component number 1 p7859[2]: Sets the global component number for the local component number 2 ... p7859[199]: Sets the global component number for the local component number 199		
Notice:	This parameter is preferably set via suitable commissioning tool (e.g. UpdateAgent, STARTER, SCOUT). Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.		
Note:	The parameter is not influenced by setting the factory setting.

Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - the drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU_LINK - if they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.

These free sampling times can be used by technology functions such as TEC, DCC or FBLOCKS.

Note:

TEC: Technology Extension

DCC: Drive Control Chart

FBLOCKS: free blocks

The displayed value depends on the following:

The specific CU version (Sinamics S provides more sampling times than Sinamics G/DCM);

The sampling times that existed in the system up until now;

The internally reserved sampling times.

Additional application and system-dependent criteria must be taken into consideration for the possibility of registering an OA runtime group or a clock cycle change.

	Min	Max	Factory setting
	0000 hex	FFFF FFFF hex	0000 hex
Description:	Sets the COB-ID for the emergency message (error telegram). It corresponds to the CANopen objects: - 1014 hex: COB-ID		
Note:	If, when downloading, the pre-set value 0 is downloaded, then the CANopen pre-set value 80 hex + Node-ID is automatically set. Online, the value 0 is rejected as, according to the CANopen Standard, COB-ID 0 is not permitted here. The changeover of the node ID using the hardware switch at the Control Unit or per software has no effect on the COB-ID EMCY. The saved value remains effective.		
p8604[0...1]	CAN life guarding / Life guarding

	Min	Max	Factory setting
	0	65535	0
Description:	Sets the life guarding parameter for the following CANopen objects: - 100C hex: Guard Time - 100D hex: Life Time Factor The life time is derived by multiplying guard time by the life time factor.		
Index:	[0] = Time interval [ms] for the life time [1] = Factor for the lifetime		
Dependency:	Refer to: p8606 Refer to: F08700		
Note:	For p8604[0] = 0 and/or p8604[1] = 0, the life guarding event service (monitoring the node guarding, fault F08700 with fault value = 2) is deactivated. The node guarding protocol is active without the life guarding event service, if the heartbeat protocol is deactivated (p8606 = 0).		
p8606	CAN Producer Heartbeat Time / Prod Heartb Time

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [ms]	65535 [ms]	0 [ms]
Description:	Sets the time [ms] to cyclically send heartbeat telegrams. The smallest cycle is 100 ms. For p8606 = 0, heartbeat telegrams are not sent.		
Dependency:	Refer to: p8604		
Note:	Corresponds to the CANopen object 1017 hex. Activating the heartbeat protocol automatically deactivates the node guarding.

Description:	General device information display.			
Index:	[0] = Vendor ID [1] = Product code [2] = Revision number [3] = Serial number			
Note:	Corresponds to the CANopen object 1018 hex. For index [3]: The SINAMICS serial number comprises 60 bits. Of these bits, the following are displayed in this index: Bits 0 ... 19: Consecutive number Bits 20 ... 23: Production ID - 0 hex: Development - 1 hex: P1 unique number - 2 hex: P2 unique number - 3 hex: WA unique number - 9 hex: Pattern - F hex: All others Bits 24 ... 27: Month of manufacture (0 means January, B means December) Bits 28 ... 31: Year of manufacture (0 means 2002)

	0	1	0	
Description:	As a result of a Bus Off error, the CAN controller is set into the initialization state. For index [0]: The CAN controller is manually started after resolving the cause of the error with p8608[0] = 1 For index [1]: The automatic CAN bus start function is activated using p8608[1] = 1. At 2 second intervals, the CAN controller is automatically restarted until the cause of the error has been resolved and a CAN connection has been established.			
Value:	0: Inactive 1: Start CAN controller			
Index:	[0] = Manual controller start function [1] = Activating the automatic controller start function			
Note:	For index [0]: This parameter is automatically reset to 0 after start.

Description:	Displays the Pre-defined Error Field of the CAN node. It includes the number of all errors that have occurred, the number of errors that have occurred for each drive and the errors according to their history. The first 16 bits represent the CANopen error code and the second 16 bits the SINAMICS error code. Index 1 has the same structure - however, the drive object ID is in the second 16 bits instead of the SINAMICS error code. CANopen error code: 0000 hex: No error present. 8110 hex: Alarm A08751 present. 8120 hex: Alarm A08752 present. 8130 hex: Alarm A08700(F) with alarm value = 2 present. 1000 hex: Generic error 1 present (there is at least one fault outside the range 8700 ... 8799) 1001 hex: Generic error 2 present (there is at least one alarm in the range 8700 ... 8799 with the exception of A08751, A08752, A08700) All drive objects are acknowledged by writing the value 0 to index 0. As soon as a fault has been acknowledged or an alarm cleared, then it is also cleared from the fault list.

Description:

Sets the identifier (client/server and server/client) of the additional SDO server.

Using these SDO servers, it is possible to access manufacturer-specific CANopen objects of the supported drive objects.

Index:

[0] = COB-ID drive object from the client to the server

Description:

Display or setting of the CANopen Node ID.

The Node ID can be set as follows:

1) Using the address switch on the Control Unit.

--> p8620 can then only be read and displays the selected Node ID.

--> A change only becomes effective after a POWER ON.

--> CANopen Node ID and PROFIBUS address are identical.

2 Parameters

2.2 List of parameters

2) Using p8620

--> Only if address 0 is set using the address switch.

--> the Node ID is set as standard to 126.

--> A change only becomes effective after save and POWER ON.

Dependency:

Refer to: r8621

Note:

Every node ID change only becomes effective after a POWER ON.

The active node ID is displayed in r8621.

The parameter is not influenced by setting the factory setting.

It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (prerequisite: the address 0 is set for the address switch).

For bit 10:

When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.

For bit 10, 12:

When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:

p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)

p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Description:	Selects the node address for the SINAMICS Link on the Communication Board Ethernet 20 (CBE20). p8836 = 0: SINAMICS Link deactivated p8836 = 1 ... 64: SINAMICS Link node address		
Dependency:	Refer to: p8811, p8835		
Note:	The maximum number of permitted participant addresses is limited by the project selection p8811. SINAMICS Link requires that the appropriate CBE20 firmware version is selected (p8835 = 3). A change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting.		

p8837	IF2 STW1.10 = 0 mode / IF2 STW1.10=0		
VECTOR_G, B_INF, ENC	Can be changed: T Data type: Integer16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 2	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2
Description:	Sets the processing mode for PROFIdrive STW1.10 "master control by PLC". Generally, control world 1 is received with the first receive word (PZD1) (this is in conformance to the PROFIdrive profile). The behavior of STW1.10 = 0 corresponds to that of the PROFIdrive profile. For other applications that deviate from this, the behavior can be adapted using this particular parameter.		
Value:	0: Freeze setpoints and continue to process sign-of-life 1: Freeze setpoints and sign-of-life 2: Do not freeze setpoints		
Recommendation:	Do not change the setting p2037 = 0.		
Note:	If the STW1 is not transferred according to the PROFIdrive with PZD1 (with bit 10 "master control by PLC"), then p2037 should be set to 2.

Description:	Assignment of the hardware for cyclic communications via PZD interface 1 (IF1) and interface 2 (IF2).		
Value:	0: Inactive 1: Control Unit onboard 2: COMM BOARD 99: Automatic		
Index:	[0] = Interface 1 [1] = Interface 2		
Dependency:	Refer to: p2030, p8815		
Note:	For value = 99 (automatic) the following applies: - if a COMM BOARD is not inserted, then the onboard interface (PROFIBUS/PROFINET/USS) communicates via IF1. - if a CBE20 is inserted, then the following applies: -- CU320-2 DP: PROFINET CBE20 communicates via IF1 and PROFIBUS/USS via IF2. -- CU320-2 PN: PROFINET onboard communicates via IF1 and PROFINET CBE20 via IF2. - CAN CBC10 always communicates via IF2. For a value not equal to 99 (automatic) the following applies: - both indices must be set to a number not equal to 99 (automatic). A change only becomes effective after POWER ON, reset or download.		
p8840	COMM BOARD monitoring time / CB t_monit		
CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Communications Not for motor type: - Min 0 [ms]	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535000 [ms]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 20 [ms]
Description:	Sets the monitoring time to monitor the process data received via COMM BOARD. If, during this time, the Control Unit does not receive any process data from the COMM BOARD, then an appropriate message is output.		

2 Parameters

2.2 List of parameters

Dependency: Refer to: p8835

Note: This monitoring function only monitors the connection between the Control Unit and COMM BOARD and not the data traffic on the fieldbus.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" or "EtherNet/IP" (p8835 = 3, 4, 5).
For CBE20 firmware version Modbus TCP (p8835 =5) then the fieldbus data traffic is also monitored.
Value = 0: Monitoring is deactivated.

p8841[0...239] COMM BOARD send configuration data / CB s config_dat

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 65535	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
---	--	--	---

Description: Sets the send configuration data for the COMM BOARD.
The setting is activated with p8842.

Dependency: Refer to: p8842

Note: The configuration data are specific to the inserted COMM BOARD.
For CBE20, the configuration data are not relevant.

p8842 Activate COMM BOARD send configuration / CB s config act

CU_G130_PN (COMM BOARD, PN CBE20), CU_G150_PN (COMM BOARD, PN CBE20), CU_G130_DP (COMM BOARD, PN CBE20), CU_G150_DP (COMM BOARD, PN CBE20)	Can be changed: U, T Data type: Unsigned16 P-Group: Communications Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: 2199, 2200 Unit selection: - Expert list: 1 Factory setting 0
---	--	--	--

Description: Activate a modified send configuration for COMM BOARD.
With p8842 = 1, the values in p8841 are transferred to the COMM BOARD and activated. After this, p8842 is automatically set to zero.

Dependency: Refer to: p8841

Note: For CBE20, certain SINAMICS parameters are newly evaluated and activated. An existing, cyclic bus connection is interrupted.
For CBE20, the parameter is only active for firmware version "SINAMICS Link" (p8835 = 3).

2.2 List of parameters

Dependency: Refer to: p8905, r8910
Note: An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.
The interface configuration (p8900 and following) is activated with p8905 = 1.
The parameter is not influenced by setting the factory setting.
IE: Industrial Ethernet

Description:	Setting to activate the interface configuration for the Industrial Ethernet interface (X127) on the Control Unit. p8905 is automatically set to 0 at the end of an operation.		
Value:	0: No function 1: Activate configuration 2: Activate and save configuration 3: Delete configuration		
Dependency:	Refer to: p8900, p8901, p8902, p8903, p8904 Refer to: A08561		
Note:	When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8905 is set = 1 or 2. For p8905 = 1: The interface configuration (p8900 and following) is activated. For p8905 = 2: The interface configuration (p8900 and following) is activated and saved to non-volatile memory. For p8905 = 3: The interface configuration is reset to the factory setting at all points. The factory settings for the interface configuration are loaded on activation (p8905 = 1) or at the next POWER ON.

Description:	Sets the maximum telegram length for the Ethernet connection to a commissioning tool (STARTER, Startdrive, HMI).		
Value:	0: 240 bytes 1: 480 bytes 2: 960 bytes		

2 Parameters

2.2 List of parameters

Note: The parameter is effective for Ethernet interfaces (Ethernet X127, PROFINET X150, PROFINET CBE20 X1400).
The telegram length actually used is negotiated between the participants.
We recommend that the telegram length is reduced to 240 bytes in the following cases:
- routed connections are otherwise not possible.
- operation with a SINUMERIK 840D.
A change only becomes effective after a POWER ON or reset.
The parameter is not influenced by setting the factory setting.

Description: Activation of the FTP server.
Permits the FTP access to the /INSTALL/SINAMICS directory of the memory card.

Value:
0: No
1: Yes

Note: Activation of the FTP server becomes effective immediately.
Deactivation only becomes effective after a POWER ON of the Control Unit.
Before the first commissioning, the FTP server is activated irrespective of the parameter setting.

Description:	Sets the subnet mask for the onboard PROFINET interface on the Control Unit. The actual subnet mask is displayed in r8933.		
Dependency:	Refer to: p8925, r8933		

Note: The interface configuration (p8920 and following) is activated with p8925.
The parameter is not influenced by setting the factory setting.

p8924	PN DHCP Mode / PN DHCP Mode		
CU_G130_PN, CU_G150_PN	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0
Description:	Sets the DHCP mode for the onboard PROFINET interface on the Control Unit. The actual DHCP mode is displayed in r8934.		
Value:	0: DHCP off 2: DHCP on, identification using MAC address 3: DHCP on, identification via name of station		
Dependency:	Refer to: p8925, r8934		
Notice:	When the DHCP mode is active (p8924 not equal to 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	The interface configuration (p8920 and following) is activated with p8925. The active DHCP mode is displayed in parameter r8934. The parameter is not influenced by setting the factory setting.		

p8925	Activate PN interface configuration / PN IF config		
CU_G130_PN, CU_G150_PN	Can be changed: U, T	Calculated: -	Access level: 3

	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	3	0
Description:	Setting to activate the interface configuration for the onboard PROFINET interface on the Control Unit. p8925 is automatically set to 0 at the end of the operation.		
Value:	0: No function 1: Activate configuration 2: Activate and save configuration 3: Delete configuration		
Dependency:	Refer to: p8920, p8921, p8922, p8923, p8924 Refer to: A08563		
Notice:	When the DHCP mode is active (p8924 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.		
Note:	When a project is downloaded, the interface configuration is only activated if, in the offline project, parameter p8925 is set = 1 or 2. For p8925 = 1: The interface configuration (p8920 and following) is activated. For p8925 = 2: The interface configuration (p8920 and following) is activated and saved to non-volatile memory. For p8925 = 3: Restores all memory locations for the interface configuration to the factory settings. The factory settings for the interface configuration are loaded on activation (p8925 = 1) or at the next POWER ON.

Dependency:	Refer to: r8961, r8962		
Note:	The parameter is active when the "PROFINET Device" and "EtherNet/IP" protocols are selected (p2030 = 7, 10). For PROFINET, the following applies: For two connections (Shared Device or system redundancy) the display in the index depends on the sequence in which the connections are established. The IP addresses of controllers 1 and 2 are displayed in r8961 and r8962. The following states are displayed for system redundancy: Primary controller: r8936[x] = 13 Backup controller: r8936[x] = 11 If value = 10: If the connection remains in this state, then when using PROFINET IRT the following can apply: - topology error (incorrect port assignment). - synchronization missing. For EtherNet/IP, the following applies: Only a cyclic connection is possible for EtherNet/IP. Index 0 indicates the status of the cyclic connection.

Description:	Setting to activate the interface configuration for the Communication Board Ethernet 20/25 (CBE20/CBE25). p8945 is automatically set to 0 at the end of an operation.			
Value:	0: No function 1: Activate configuration 2: Activate and save configuration 3: Delete configuration			
Dependency:	Refer to: p8940, p8941, p8942, p8943, p8944 Refer to: A08565			
Notice:	When the DHCP mode is active (p8944 > 0), then PROFINET communication via this interface is no longer possible! However, the interface can be used by the STARTER/SCOUT commissioning tool.			
Note:	For CBE20, the parameter is only valid for firmware version "PROFINET Device" (p8835 = 1), "EtherNet/IP" (p8835 = 4) or "MODBUS TCP (p8835 = 5). Otherwise, it is locked. This restriction is not applicable for the CBE25. When a project is downloaded, the interface configuration is only activated if parameter p8945 is set = 1 or 2 in the offline project. For p8945 = 1: The interface configuration (p8940 and following) is activated. For p8945 = 2: The interface configuration (p8940 and following) is activated - and is saved in a non-volatile fashion (retentively). For p8945 = 3: All storage locations for the interface configuration are restored to the factory setting. The factory setting of the interface configuration is loaded when activated (p8945 = 1) or with the next POWER ON.

r8962[0...3]	PN IP Address Remote Controller 2 / IP Addr Rem Ctrl2
CU_G130_PN, CU_G150_PN	Can be changed: - Calculated: - Access level: 3 Data type: Unsigned8 Dyn. index: - Func. diagram: - P-Group: - Unit group: - Unit selection: - Not for motor type: - Scaling: - Expert list: 1 Min Max Factory setting 0 255 -
Description:	Displays the IP address of the second PROFINET controller connected with the device via PN onboard. The display is only relevant for Shared Device - or system redundancy.
<hr/>	
p8969	PROFIsafe wait for clock synchronization / PS wait sync
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: U, T Calculated: - Access level: 3 Data type: Integer16 Dyn. index: - Func. diagram: - P-Group: - Unit group: - Unit selection: - Not for motor type: - Scaling: - Expert list: 1 Min Max Factory setting 0 1 0
Description:	Setting for the behavior of a PROFIsafe communication connection depending on another isochronous communication connection.
Value:	0: No 1: Yes
Recommendation:	A value of 1 is recommended, if problems are encountered with the PROFIsafe connection when synchronizing.
Note:	If value = 1: A PROFIsafe connection is only accepted if an isochronous connection exists. Relevant, if PROFIsafe and isochronous operation are configured via various communication connections (e.g. PROFINET Shared Device).
<hr/>	
r8970[0...3]	CBE2x subslot controller assignment / CBE2x subslot
CU_G130_PN (PN CBE20), CU_G150_PN (PN CBE20), CU_G130_DP (PN CBE20), CU_G150_DP (PN CBE20), VECTOR_G (PN CBE20), B_INF (PN CBE20), TM31 (PN CBE20), TM120 (PN CBE20), TM150 (PN CBE20), TB30 (PN CBE20), ENC (PN CBE20)	Can be changed: - Calculated: - Access level: 3 Data type: Unsigned8 Dyn. index: - Func. diagram: - P-Group: - Unit group: - Unit selection: - Not for motor type: - Scaling: - Expert list: 1 Min Max Factory setting 0 8 -
Description:	Displays the controller assignment of a PROFINET subslot on the actual drive object.
Index:	[0] = Subslot 2 PROFIsafe [1] = Subslot 3 PZD telegram [2] = Subslot 4 PZD supplementary data [3] = Subslot 5 PZD supplementary data
Dependency:	Refer to: r8971, r8972
Note:	Example: If the parameter contains the value 2 in index [1], then this means that subslot 3 is assigned to controller 2.

r8971[0...3]	CBE2x IP Address Remote Controller 1 / CBE2x IP Rem Ctrl1			
CU_G130_PN (PN CBE20), CU_G150_PN (PN CBE20), CU_G130_DP (PN CBE20), CU_G150_DP (PN CBE20)	Can be changed: - Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the IP address of the first PROFINET controller connected with the device via CBE20/CBE25.			
r8972[0...3]	CBE2x IP Address Remote Controller 2 / CBE2x IP Rem Ctrl2			
CU_G130_PN (PN CBE20), CU_G150_PN (PN CBE20), CU_G130_DP (PN CBE20), CU_G150_DP (PN CBE20)	Can be changed: - Data type: Unsigned8 P-Group: - Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 255	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -	
Description:	Displays the IP address of the second PROFINET controller connected with the device via CBE20/CBE25.			
p8984[0...1]	BI: Web server interface enable signal source / Webserv enab s_src			
CU_G130_PN, CU_G150_PN	Can be changed: T Data type: Unsigned32 / Binary P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 1 [1] 0	
Description:	Sets the signal source to enable the interface to access the web server.			
Index:	[0] = Reserved [1] = PROFINET X150			
Dependency:	The web server must be activated using p8986.0 = 1 before it can be used. Refer to: p8986			
Note:	BI:p8984[1] = 1 signal: PROFINET interface X150 is enabled for access to the web server. BI:p8984[1] = 0 signal: PROFINET interface X150 is blocked for access to the web server.			
p8985[0...1]	Web server interface configuration / WebServ interf con			
CU_G130_PN, CU_G150_PN	Can be changed: T Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting [0] 0000 bin [1] 0001 bin	
Description:	Setting to block the interface for the http access to the web server.			
Index:	[0] = Reserved [1] = PROFINET X150			
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Inhibit access via http	Yes	No
				FP -

2 Parameters

2.2 List of parameters

Dependency: p8985[1].0 is only relevant for:
 - p8986.0 = 1 (activate web server)
 - p8986.1 = 0 (enable http)
 - p8984[1] = 1 signal (enable the web server for X150)
 Refer to: p8984, p8986

Note: p8985[1].0 = 1:
 PROFINET interface X150 is blocked for http access to the web server.
 p8985[1].0 = 0:
 PROFINET interface X150 is enabled for http access to the web server.

p8986		Web server configuration / Web serv config			
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: T	Calculated: -	Access level: 3		
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -		
	P-Group: -	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0101 bin		
Description:	Setting to activate and configure the "Web server" function in the drive. It is possible to access the web server via the integrated Ethernet and PROFINET interfaces of the drive. The addressing is realized via the set IP address.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Activating	Yes	No	-
	01	Only permit access via https	Yes	No	-
	02	Enable "SINAMICS" user	Yes	No	-
	03	Enable "Administrator" user	Yes	No	-

p8987[0...1]		Web server port assignment / WebServ PortAssign		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	1	32767	[0] 80 [1] 443	
Description:	Sets the port assignment for the web server.			
Index:	[0] = Port for standard transfer (http) [1] = Port for secure transfer (https)			
Note:	With the exception of values 80 and 443, values greater than or equal to 1024 are permitted.			

p8994[0...1]		BI: Comm tool interface enable signal source / Comm enab s_src		
CU_G130_PN, CU_G150_PN	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: -	
	P-Group: -	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	[0] 1 [1] 1	
Description:	Sets the signal source to enable the interface to access a commissioning tool.			
Index:	[0] = Reserved [1] = PROFINET X150			
Note:	The parameter influences access operations initiated by STARTER, Startdrive and SIMATIC HMI. BI: p8994[1] = 1 signal: PROFINET interface X150 is enabled for access by a commissioning tool. BI: p8994[1] = 0 signal: PROFINET interface X150 is blocked for access by a commissioning tool.			

p9206[0...2]		Topology direct access / Topo access		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: T	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -	
	P-Group: Topology	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	4294967295	0	
Description:	Data setting to read topology properties. The result is displayed depending on the property in r9207 or r9208. For index [0]: 0: actual topology, 1: target topology For index [1]: Sets the component number of the component involved. For index [2]: 7: Name (r9208) 8: Component type (r9207) 9: Number of DRIVE-CLiQ connections (r9207) 11: Manufacturer (upper byte) and version (lower byte) (r9207) 12: Serial number (r9208) 13: Index (r9207) 15: Comparison level (r9207) 23: Article number (r9207) 24: Hardware serial number (r9208) 25: Envelope article number (r9207) 28: Firmware version (r9207) 29: EEPROM version (r9207) 30: Hardware version (r9207) 1000: Name of DRIVE-CLiQ connection 0 (r9208) 1001: Name of DRIVE-CLiQ connection 1 (r9208) ... 1015: Name of DRIVE-CLiQ connection 15 (r9208)			
Index:	[0] = Actual topology/target topology [1] = Component number [2] = Identifier/property			
Dependency:	Refer to: r9207, r9208			

r9207		Topology direct access integer value / Topo access int		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: -	Calculated: -	Access level: 3	
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -	
	P-Group: Topology	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	-	-	-	
Description:	Displays the value for the property set in p9206. A value is only displayed for integer type properties.			
Dependency:	Refer to: p9206, r9208			

2 Parameters

2.2 List of parameters

r9208[0...50]	Topology direct access string / Topo access string		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: - Data type: Unsigned8 P-Group: Topology Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the value for the property set in p9206. A value is only displayed for string type properties.		
Dependency:	Refer to: p9206, r9207		
Note:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual.		
<hr/>			
p9210	Flashing component number / Flash comp_no.		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: U, T Data type: Unsigned16 P-Group: Topology Not for motor type: - Min 0	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 499	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the component number for a component to get its status LED to flash.		
Dependency:	Refer to: p9211		
<hr/>			
p9211	Flash function / Flash fct.		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: U, T Data type: Integer16 P-Group: Topology Not for motor type: - Min -1	Calculated: - Dyn. index: - Unit group: - Scaling: - Max 1	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -1
Description:	Sets the function for the components selected in p9210. After initiating a function, the parameter is automatically reset again. Example: - set the component number (p9210). - select the "flashing on" function (set p9211 = 1).		
Value:	-1: Select function 0: Flashing off 1: Flashing on		
Dependency:	Refer to: p9210		
Notice:	If a task cannot be executed (e.g. the component number in p9210 does not exist), the following applies: - there is no negative feedback signal. - the value is reset anyway.		
<hr/>			
r9220	Statistics number of entries / Stat entries qty		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: - Data type: Unsigned16 P-Group: - Not for motor type: - Min -	Calculated: - Dyn. index: - Unit group: - Scaling: - Max -	Access level: 4 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the number of statistic entries in r9222.		
Dependency:	In p9221, the component Id is set whose statistical entries are to be displayed. Refer to: p9221		

p9221	Statistic components Id / Statistic comp Id		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: T	Calculated: -	Access level: 4
	Data type: Unsigned8	Dyn. index: -	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0000 hex	00FF hex	0002 hex
Description:	Selects the component Id whose statistics are to be displayed in r9222.		
r9222[0...n]	Statistic DRIVE-CLiQ acyclic communication / Stat DQ acycl comm		
CU_G130_PN, CU_G150_PN, CU_G130_DP, CU_G150_DP	Can be changed: -	Calculated: -	Access level: 4
	Data type: Unsigned32	Dyn. index: r9220	Func. diagram: -
	P-Group: -	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-
Description:	Displays the statistics for the acyclic DRIVE-CLiQ communication of a component. The component is preset in p9221. The entry comprises the following elements: Index 0: Parameter Id. Index 1: Number of messages sent. Index 2: Minimum time of all acyclic tasks referred to parameter Id (index 0). Index 3: Maximum time of all acyclic requests referred to the parameter Id (index 0). Index 4: Average of all acyclic requests referred to the parameter Id (index 0). The time unit is 10 µs.		
Dependency:	The number of statistic entries is displayed in p9220. In p9221, the component Id can be set whose statistic is to be displayed. Refer to: r9220, p9221		
Note:	As a statistic entry comprises 5 data, when calling the entries via the terminal, a size that represents a multiple of 5 must be specified. Example: The 2nd entry should be called: rdp 1 9222 5 5 or rdpa 1 9222 5 5		
p9300	SI Motion monitoring clock cycle (Motor Module) / SI Mtn clock MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	500.00 [µs]	25000.00 [µs]	12000.00 [µs]
Description:	Sets the monitoring clock cycle for safe motion monitoring.		
Dependency:	Refer to: p9500, p9511 Refer to: F01652		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The monitoring clock cycle must be a multiple of the actual value sensing clock cycle in p9311 or of the DP clock cycle. A change only becomes effective after a POWER ON.		

p9301 SI Motion enable safety functions (Motor Module) / SI Mtn enable MM

VECTOR_G **Can be changed:** C2(95) **Calculated:** - **Access level:** 3

	27	Enable referencing via SCC	Enable	Inhibit	-
	28	Enable safe cam	Enable	Inhibit	-
	29	Enable synchronous transfer safe position via PROFIsafe	Enable	Inhibit	-

Dependency: Refer to: p9501
Refer to: F01682, F01683

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: A change only becomes effective after a POWER ON.
SCA: Safe Cam
SDI: Safe Direction (safe motion direction)
SLA: Safely-Limited Acceleration
SLP: Safely-Limited Position
SLS: Safely-Limited Speed
SOS: Safe Operating Stop
SP: Safe Position
SS2E: Safe Stop 2 external (Safe Stop 2 with external stop, external STOP D)
SS2ESR: Safe Stop 2 Extended Stop and Retract
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

Min **Max** **Factory setting**
0 1 0

Description: Sets the axis type (linear axis or rotary axis/spindle).

Value: 0: Linear axis
1: Rotary axis/spindle

Dependency: Refer to: p9502

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For the commissioning tool, after changing over the axis type, the units dependent on the axis type are only updated after a project upload.
A change only becomes effective after a POWER ON.

p9303	SI Motion SCA (SN) enable (MM) / SI Mtn SCA enab MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3

	28	Enable SCA29 (SN29)	Enable	Inhibit	-
	29	Enable SCA30 (SN30)	Enable	Inhibit	-

Dependency: Refer to: p9501
Refer to: F01686

Note: The "Safe Cam" function (SCA) can either be enabled using p9501 or p9503.
SCA: Safe Cam / SN: Safe software cam

p9305		SI Motion SP modulo value (Motor Module) / SI mtn SP mod MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3	
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -	
	P-Group: Safety Integrated	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0 [°]	737280 [°]	0 [°]	
Description:	Sets the modulo value in degrees for rotary axes of the "Safe position" function. This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled. The value should be set, so that it is precisely at 2 ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump. The modulo function is deactivated for a value = 0.			
Dependency:	Refer to: F01681			
Notice:	When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F30681 will be output. If the absolute position is not enabled, then the parameterized modulo value is not taken into account. This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	SLP: Safely-Limited Position SP: Safe Position			

p9306		SI Motion function specification (Motor Module) / SI Mtn fct_spc MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3	
	Data type: Integer16	Dyn. index: -	Func. diagram: -	
	P-Group: Safety Integrated	Unit group: -	Unit selection: -	
	Not for motor type: -	Scaling: -	Expert list: 1	
	Min	Max	Factory setting	
	0	3	0	
Description:	Sets the function specification for the safe motion monitoring.			
Value:	0: Safety with encoder and accel_monitoring (SAM) / delay time 1: Safety without encoder and brake ramp (SBR) 2: Safety with encoder and brake ramp (SBR) 3: Safety without encoder with accel_monitoring (SAM) / delay time			
Dependency:	Refer to: C30711			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			

p9307		SI Motion function configuration MM / SI mtn config MM			
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3		
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -		
	P-Group: Safety Integrated	Unit group: -	Unit selection: -		
	Not for motor type: -	Scaling: -	Expert list: 1		
	Min	Max	Factory setting		
	-	-	0000 0000 bin		
Description:	Sets the function configuration for the safe motion monitoring functions.				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Extended message acknowledgment	Yes	No	-
	01	Setpoint velocity limit for STOP F	No	Yes	-
	02	Actual value sensing encoderless motor type	Synchronous motor	ASM/RESM	-
	03	SS1 with OFF3 (brake response)	SS1E external stop	SS1 with OFF3	-
	05	Actual value sensing sensorless edge modulation	Yes	No	-
	06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-
Dependency:	Refer to: C01711				

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: For bit 00:
When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO.

For bit 01:
When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active.

For bit 02:
This bit defines the type of motor, which the sensorless actual value sensing evaluates.
For bit = 0, the actual speed is calculated for an induction/reluctance motor.
For bit = 1, the actual speed is calculated for a synchronous motor. This value depends on the setting in p0300.
Bit = 0 should be set if no motor is defined (p0300 = 0).

For bit 03:
When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated.
SS1E: Safe Stop 1 external (Safe Stop 1 with external stop)

For bit 05:
This bit defines the type of modulation, which the sensorless actual value sensing evaluates.
For bit = 0, the actual velocity is calculated for space vector modulation.
For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802.

Description: Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-
	08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-

Dependency: Refer to: C01711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

For bit 00:

If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.

Note: SDI: Safe Direction (safe motion direction)

SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)

For bit 00:

For bit = 1 and with the SSM safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level.

For bit = 0 and with the SSM safety function activated, the following applies:

- Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state.

For bit 08:

For bit = 1 and with the SDI safety function activated, the following applies:

- During pulse suppression, monitoring is switched off and the status signal indicates inactive.

2 Parameters

2.2 List of parameters

For bit = 0 and with the SDI safety function activated, the following applies:

- Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	Sets the clock cycle time of the actual value sensing for safe motion monitoring. Setting criteria if the motion monitoring functions are executed with an encoder. - a slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing. - the maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730. - the isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used. Setting criteria if the motion monitoring functions are executed without an encoder: - the actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p0115[0]). For SINAMICS S120M, the following applies: Only setting p9311 = 0 or 2 ms is possible (a value of 0 is internally assumed to be 2).			
Dependency:	Refer to: p0115, p9300, p9511 Refer to: F01652			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1). The monitoring clock cycle from p9300 must be an integer multiple of this parameter. In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended. The clock cycle time of the actual value sensing should not be set to more than 8 ms. A change only becomes effective after a POWER ON.

Description:	Sets the stop response for the "Safely-Limited Position" function (SLP).		
Value:	0: STOP A 1: STOP B 2: STOP C 3: STOP D 4: STOP E 10: STOP A with delayed stop response when the bus fails 11: STOP B with delayed stop response when the bus fails 12: STOP C with delayed stop response when the bus fails 13: STOP D with delayed stop response when the bus fails 14: STOP E with delayed stop response when the bus fails		
Index:	[0] = Limit value SLP1 (SE1) [1] = Limit value SLP2 (SE2)		
Dependency:	Refer to: p9534, p9535		
Note:	In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F). SLP: Safely-Limited Position

	Min	Max	Factory setting
	0.00 [µs]	600000000.00 [µs]	100000.00 [µs]
Description:	Sets the delay time for the function "Safe motion direction" (SDI). After selecting the SDI function, then for a maximum of this time, motion in the monitored direction is permissible. This time can therefore be used for braking any motion.		

Dependency:	Refer to: p9364, p9366 Refer to: C30716
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle. SDI: Safe Direction (safe motion direction)

	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	14	1

Description: Sets the stop response for the "Safe Direction" function (SDI).
This setting applies to both directions of motion.
In the case of encoderless motion monitoring (p9306 = 1), only a value of 0 or 1 is permitted.

Value:	0: STOP A
	1: STOP B
	2: STOP C
	3: STOP D
	4: STOP E
	10: STOP A with delayed stop response when the bus fails
	11: STOP B with delayed stop response when the bus fails
	12: STOP C with delayed stop response when the bus fails
	13: STOP D with delayed stop response when the bus fails
	14: STOP E with delayed stop response when the bus fails

Dependency:	Refer to: p9364, p9365 Refer to: C30716
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.
Note:	In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F). SDI: Safe Direction (safe motion direction)

p9368	SI Motion SAM/SBR velocity limit (Motor Module) / SI Mtn SAM v_limMM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [mm/min]	1000.00 [mm/min]	0.00 [mm/min]

Description: Sets the velocity limit for the "SAM" and "SBR" functions.
If the drive is being ramped down, but accelerates by the tolerance in p9548/p9348, then the SAM function identifies this and a STOP A is initiated.

The monitoring operates as follows:

- monitoring by SAM is activated for SS1 (or STOP B) and SS2 (or STOP C).
- the SAM limit value is frozen after the velocity limit in p9568/p9368 is undershot.
- SAM monitoring is still executed until the transition time to SOS/STO has expired.

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: SAM: Safe Acceleration Monitor (safe acceleration monitoring)
SBR: Safe Brake Ramp (safe brake ramp monitoring)
SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring)
For p9568 = p9368 = 0, the following applies:
The value in p9546/p9346 (SSM) is applied as the velocity limit for SAM/SBR.

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	100000	1000
Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The parameter is only effective when PROFIsafe telegram 901 is selected. By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor. If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C30711 is output with value 7001 - along with the STOP F safety stop response.

Description:	Sets the delay time, after which the stop response parameterized in p9612 for bus failure is executed.		
Dependency:	Refer to: p9363		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F). The main use of the wait time is the function "Extended stopping and retraction" (ESR). The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description:	Sets the delay time for monitoring the brake ramp. Monitoring of the brake ramp starts once the delay time has elapsed.		
Dependency:	Refer to: p9381, p9383		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle. Internally, the set time is limited downwards to 2 safety monitoring clock cycles (2 * p9500/p9300).

	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1	4	-1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: p9507 Refer to: F30681, C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction/reluctance motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).		

p9386	SI Motion actual value sensing sensorless delay time (MM) / ActVal si t_del MM

	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	5.00 [ms]	1000.00 [ms]	100.00 [ms]
Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C30711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C30711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock cycle.		

p9387	SI Motion actual value sensing sensorless filter time (MM) / Actv sl t_filt MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [µs]	100000.00 [µs]	25000.00 [µs]
Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. A longer filter time results in a longer response time.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9387 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9388	SI Motion actual value sensing sensorless minimum current (MM) / ActVal sl I_min MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	1000.00 [%]	10.00 [%]
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - the value must be increased if C30711 has occurred with message value 1042. - the value must be decreased if C30711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: $ p0305 \times p9783 \geq p9388 \times 1.2$		
Recommendation:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785 Refer to: C30711		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive. If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).		
p9389	SI Motion actual value sensing sensorless accel. limit (MM) / ActVal sl a_lim MM		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.00 [%]	3300.00 [%]	100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - the value must be increased if C30711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		

2 Parameters

2.2 List of parameters

Recommendation: The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration.
To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9389, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.

Dependency: Refer to: r9784
Refer to: C30711

Notice: This parameter is overwritten by the copy function of the safety functions integrated in the drive.

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9389 = maximum value, the filter is deactivated.
Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Displays the number of modified parameters and those that have still not be saved for this drive object.

Dependency: Refer to: p0971, p0977

Notice: Inherent to the system, the list of the parameters to be backed up is empty after the following actions:

- Download
- Warm restart
- Factory setting

In these cases, a new parameter backup must be initiated, which is then the starting point for the list of modified parameters.

Note: The modified parameters that still need to be saved are internally listed in r9410 ... r9419.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0 [°]	737280 [°]	0 [°]

Description: Sets the modulo value in degrees for rotary axes of the "Safe position" function.
This modulo value is taken into account when safely referencing as well as when transferring the safe position via PROFIsafe when the absolute position is enabled.
The value should be set, so that it is precisely at 2ⁿ revolutions, so that when the range that can be represented (+/- 2048) overflows, this does not cause the position actual value to jump.
The modulo function is deactivated for a value = 0.

Dependency: Refer to: p9501

Refer to: F01681

Notice: When the "SLP" function is activated, the modulo function must be deactivated as otherwise fault F01681 will be output.

If the absolute position is not enabled, then the parameterized modulo value is not taken into account.

Note: SLP: Safely-Limited Position

SP: Safe Position

05	Actual value sensing sensorless edge modulation	Yes	No	-																																			
06	Configuration test stop motion monitoring functions	Test automatic	Test manual	-																																			
Dependency:	Refer to: C01711																																						
Note:	For bit 00: When the function is activated, a safety-relevant acknowledgment (internal event acknowledge) can be performed by selecting/deselecting STO. For bit 01: When the function is activated, the active setpoint velocity limit (CO: r9733) is set to zero when STOP F is active. For bit 02: This bit defines the type of motor, which the sensorless actual value sensing evaluates. For bit = 0, the actual speed is calculated for an induction/reductance motor. For bit = 1, the actual velocity is calculated for a synchronous motor. This value depends on the setting in p0300. Bit = 0 should be set if no motor is defined (p0300 = 0). For bit 03: When the bit is activated – when selecting function SS1 or activating a STOP B – an SS1E or a STOP B with Stop, which should be externally initiated, is triggered instead of SS1 with a drive-based braking response. As a consequence, brake monitoring (SBR, SAM) is deactivated. SS1E: Safe Stop 1 external (Safe Stop 1 with external stop) For bit 05: This bit defines the type of modulation, which the sensorless actual value sensing evaluates. For bit = 0, the actual velocity is calculated for space vector modulation. For bit = 1, the actual velocity is calculated for edge modulation. This value depends on the setting in p1802. For bit 06: For the automatic test stop, the test stop can still be initiated via binector input p9705. The automatic test stop is executed after power up, partial power up or a warm restart. ASM: Induction motor RESM: reluctance synchronous motor (synchronous reluctance motor)

Description:	Sets the behavior of safety functions and their feedback during pulse suppression in encoderless operation.																			
Bit field:	<table border="1"> <thead> <tr> <th>Bit</th> <th>Signal name</th> <th>1 signal</th> <th>0 signal</th> <th>FP</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>SSM during pulse suppression and encoderless</td> <td>Becomes inactive</td> <td>Remains active</td> <td>-</td> </tr> <tr> <td>08</td> <td>SDI during pulse suppression and encoderless</td> <td>Becomes inactive</td> <td>Remains active</td> <td>-</td> </tr> </tbody> </table>	Bit	Signal name	1 signal	0 signal	FP	00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-	08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-				
Bit	Signal name	1 signal	0 signal	FP																
00	SSM during pulse suppression and encoderless	Becomes inactive	Remains active	-																
08	SDI during pulse suppression and encoderless	Becomes inactive	Remains active	-																
Dependency:	Refer to: C01711																			
Notice:	For bit 00: If the OFF1 or the OFF3 ramp-down time is too low, or there is an insufficient clearance between the SSM limit speed, and the shutdown speed, then it is possible that the "speed under limit value" signal does not change to 1, because no speed actual value below the SSM limit was able to be identified before pulse cancellation. In this case, the OFF1 or the OFF3 ramp-down time or the clearance between the SSM limit speed and shutdown speed must be increased.																			
Note:	SDI: Safe Direction (safe motion direction) SSM: Safe Speed Monitor (safety-relevant feedback signal from the speed monitoring) For bit 00: For bit = 1 and with the SSM safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the feedback signal has a 0 signal level. For bit = 0 and with the SSM safety function activated, the following applies: - Monitoring continues during pulse suppression. The feedback signal last displayed before pulse suppression is kept and the system goes into the STO state. For bit 08: For bit = 1 and with the SDI safety function activated, the following applies: - During pulse suppression, monitoring is switched off and the status signal indicates inactive. For bit = 0 and with the SDI safety function activated, the following applies: - Monitoring continues during pulse suppression. The status signal indicates active and the system goes into the STO state.

Description:	Setting for isochronous communication between PROFIdrive controller and Control Unit. The parameter is only relevant, if the safety-relevant motion monitoring functions integrated in the drive have been enabled (p9601.2 =1). If a PROFIdrive controller exchanges process data isochronously with the Control Unit, then p9510 must be set to 1. This also applies if the drive itself does not exchange process data isochronously. Examples for isochronous communication: - isochronous control for the motion control (e.g. SIMOTION). - isochronous PROFIsafe master (e.g. SIMATIC S7-400F).

Dependency:	Refer to: r0474, p9315				

2 Parameters

2.2 List of parameters

- Note:**
- after starting the copy function (p9700 = 57 hex), p9515.0...5 are set the same as r0474.
 - For safety functions that are not enabled (p9501 = 0), the following applies:
 - when the system boots, p9515.16 is automatically set the same as p0404.10, p9515.17 the same as p0404.8 & 11.
 - For safety functions that are enabled (p9501 > 0), the following applies:
 - p9515.16 is checked to identify whether it coincides with p0404.10, p9515.17 with p0404.8 & 11

p9516 SI Motion encoder configuration safety functions (Control Unit) / SI Mtn enc_cfg CU

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0000 0000 bin

Description: Sets the configuration for the motor encoder and position actual value.
The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Motor encoder rotating/linear	Linear	Rotating	-
	01	Position actual value sign change	Yes	No	-
	04	No STOP A after encoder fault for 1 encoder safety	Yes	No	-

Dependency: Refer to: p0404, p0410
Refer to: F01671

- Note:**
- For safety functions that are not enabled (p9501 = 0), the following applies:
 - p9516.0 is automatically set the same as p0404.0 when the system boots.
 - p9516.1 is automatically set the same as p0410.1 when the system boots.
 - For safety functions that are enabled (p9501 > 0), the following applies:
 - p9516.0 is checked to identify whether it coincides with p0404.0.

p9517 SI Motion linear encoder grid division (Control Unit) / SI Mtn grid CU

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -

	Min	Max	Factory setting
	0.00 [nm]	250000000.00 [nm]	10000.00 [nm]

Description: Sets the grid division for a linear encoder.
The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Dependency: Refer to: p0407, p9516
Refer to: F01671

- Note:**
- For safety functions that have not been enabled (p9501 = 0), the following applies: When booting p9517 is automatically set the same as p0407.
 - For safety functions that are enabled (p9501 > 0), the following applies: p9517 is checked whether it coincides with p0407.

p9518	SI Motion encoder pulses per revolution (Control Unit) / SI Mtn puls/rev CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	16777215	2048
Description:	Sets the number of encoder pulses per revolution for rotary encoders. The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.		
Dependency:	Refer to: p0408, p9516 Refer to: F01671		
Note:	For safety functions that have not been enabled (p9501 = 0), the following applies: When booting, p9518 is automatically set the same as p0408. For safety functions that are enabled (p9501 > 0), the following applies: p9518 is checked whether it coincides with p0408.		
p9519	SI Motion fine resolution G1_XIST1 (Control Unit) / SI Mtn G1_XIST1 CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2	18	11
Description:	Sets the fine resolution for G1_XIST1 in bits. The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.		
Dependency:	Refer to: p0418 Refer to: F01671		
Note:	G1_XIST1: Encoder 1 position actual value 1 (PROFIdrive) For safety functions that are not enabled (p9501 = 0), the following applies: - p9519 is automatically set the same as p0418 at run-up. For safety functions that are enabled (p9501 > 0), the following applies: - p9519 is checked to see that it matches p0418.		
p9520	SI Motion spindle pitch (Control Unit) / SI Mtn Sp_pitch CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.1000 [mm]	8388.0000 [mm]	10.0000 [mm]
Description:	Sets the gear ratio between the encoder and load in mm/revolution for a linear axis with rotary encoder.		
Notice:	The fourth decimal point can be rounded-off depending on the size of the entered number (from 3 places before the decimal point).		

p9521[0...7]		SI Motion gearbox enc (motor)/load denominator (Control Unit) / SI Mtn gear den CU	
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2147000000	1
Description:	Sets the denominator for the gearbox between the encoder (or motor in the case of encoderless monitoring functions) and the load. The active gearbox stage can be switched over via PROFIsafe.		
Index:	[0] = Gearbox 1 [1] = Gearbox 2 [2] = Gearbox 3 [3] = Gearbox 4 [4] = Gearbox 5 [5] = Gearbox 6 [6] = Gearbox 7 [7] = Gearbox 8		
Dependency:	Refer to: p9522		

p9522[0...7]		SI Motion gearbox encoder (motor)/load numerator (Control Unit) / SI Mtn gear num CU	
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	2147000000	1
Description:	Sets the numerator for the gearbox between the encoder (or motor in the case of encoderless monitoring functions) and the load. The active gearbox stage can be switched over via PROFIsafe.		
Index:	[0] = Gearbox 1 [1] = Gearbox 2 [2] = Gearbox 3 [3] = Gearbox 4 [4] = Gearbox 5 [5] = Gearbox 6 [6] = Gearbox 7 [7] = Gearbox 8		
Dependency:	Refer to: p9521		
Note:	In the case of encoderless monitoring functions, the pole pair number must be multiplied by the numerator of the gearbox ratio. Example: Gearbox ratio 1:4, pole pair number (r0313) = 2 --> p9521 = 1, p9522 = 8 (4 x 2)		

p9523		SI Motion redundant coarse pos. value valid bits (Control Unit) / Valid bits CU	
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	16	9
Description:	Sets the number of valid bits of the redundant coarse position value. The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.		

Dependency: Refer to: r0470, p9323
Note: - after starting the copy function (p9700 = 57 hex), p9523 is set the same as r0470.

p9524 SI Motion Redundant coarse pos. value fine resolution bits (CU) / SI Mtn fine bit CU

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-16	16	-2

Description: Sets the number of valid bits for the fine resolution of the redundant coarse position value.
The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Dependency: Refer to: r0471, p9324
Note: - after starting the copy function (p9700 = 57 hex), p9524 is set the same as r0471.

p9525 SI Motion Redundant coarse pos. value relevant bits (CU) / Relevant bits CU

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	16	16

Description: Sets the number of relevant bits for the redundant coarse position value.
The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.

Dependency: Refer to: p0414, r0472, p9325
Note: For safety functions that are not enabled (p9501 = 0), the following applies:
- p9525 is automatically set the same as r0472 when the system boots.
For safety functions that are enabled (p9501 > 0), the following applies:
- p9525 is checked to see that it matches r0472.

p9526 SI Motion encoder assignment second channel / SI Mtn enc chan 2

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1	3	1

Description: Sets the number of the encoder that the second channel (control, Motor Module) uses for safe motion monitoring functions.

Dependency: For the safe motion monitoring functions, the redundant safety position actual value sensing must be activated in the appropriate encoder data set (p0430.19 = 1).

Refer to: p0187, p0188, p0189, p0430

Note: For p9526 = 1, the encoder for the closed-loop speed control is used for the second channel of the motion monitoring functions (1-encoder system).

A change only becomes effective after a POWER ON.

p9529	SI Motion Gx_XIST1 coarse pos. safe most significant bit (CU) / Gx_XIST1 MSB CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	31	14
Description:	Sets the bit number for the safe most significant bit (MSB) of the Gx_XIST1 coarse position. The encoder that is used for the safe motion monitoring functions on the Control Unit must be parameterized in this parameter.		
Dependency:	Refer to: p0415, r0475, p9329		
Note:	For safety functions that are not enabled (p9501 = 0), the following applies: - p9529 is automatically set the same as r0475 when the system boots. For safety functions that are enabled (p9501 > 0), the following applies: - p9529 is checked to see that it matches r0475. MSB: Most Significant Bit		
p9530	SI Motion standstill tolerance (Control Unit) / SI Mtn standst_tol

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.000 [%]	100.000 [%]	80.000 [%]
Description:	This is an evaluation factor to define the setpoint limit from the selected actual speed limit. The active SLS limit value is evaluated with this factor and is made available as setpoint limit in r9733.		

2 Parameters

2.2 List of parameters

Dependency: This parameter only has to be parameterized for the motion monitoring functions integrated in the drive (p9601.2 = 1)
 $r9733[0] = p9531[x] \times p9533$ (converted from the load side to the motor side)
 $r9733[1] = - p9531[x] \times p9533$ (converted from the load side to the motor side)
[x] = Selected SLS stage
Conversion factor from the motor side to the load side:
- motor type = rotary and axis type = linear: $p9522 / (p9521 \times p9520)$
- otherwise: $p9522 / p9521$
Refer to: p9501, p9531, p9601

Note: The active actual speed limit is selected via safety-relevant inputs (SGE).
When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.
SLS: Safely-Limited Speed

p9534[0...1] SI Motion SLP (SE) upper limit values (Control Unit) / SI Mtn SLP up lim

VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3

Description: Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

Description:	Sets the scaling factor to transfer the safe position via PROFIsafe in the 16-bit notation.		
Dependency:	Refer to: r9713		

2 Parameters

2.2 List of parameters

Note: The parameter is only effective when PROFIsafe telegram 901 is selected.
By selecting a suitable scaling of the 32 bit position actual value (r9713[0]), it must be ensured that the scaled position actual value is not greater than 16 bit. The scaling is realized by dividing r9713[0] with this scaling factor.
If, during operation, a position actual value is determined that cannot be scaled to 16 bits, then message C0711 is output with value 7001 - along with the STOP F safety stop response.

	0.00 [ms]	800.00 [ms]	0.00 [ms]
Description:	Sets the delay time, after which the stop response parameterized in p9612 for bus failure is executed.		
Dependency:	Refer to: p9561, p9563		
Note:	In the extended sense, a bus failure should be seen here as a communication error in the control signals of the safety functions (e.g. via PROFIsafe or TM54F). The main use of the wait time is the function "Extended stopping and retraction" (ESR). The set time is rounded internally to an integer multiple of the monitoring clock cycle.

Description:	Sets the monitoring time to define the brake ramp. The rate of rise of the brake ramp depends upon p9581 (reference value) and p9583 (monitoring time).		
Dependency:	Refer to: p9581, p9582		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9585	SI Motion actual value sensing sensorless fault tolerance (CU) / ActVal sl tol CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Integer32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-1	4	-1
Description:	Sets the tolerance of the plausibility monitoring of the current and voltage angle. A higher value results in a higher degree of ruggedness when reversing at low speeds, as well as in the field weakening range for load steps. An increase is advantageous, if the current or voltage at the motor become small.		
Dependency:	Refer to: r9787 Refer to: F01681, C01711		
Notice:	Reducing this value can have a negative impact on the actual value sensing and the plausibility check. When the value is increased, this results in a longer evaluation delay and a higher velocity deviation (r9787).		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For synchronous motors, the value 4 must be set. If value = -1: - for synchronous motors, the calculation is automatically made with the value 4. - for induction/reluctance motors, the calculation is automatically made with a value of 0 (if the code number of the power unit p0201[0] < 14000, otherwise with a value of 2).		
p9586	SI Motion actual value sensing sensorless delay time (CU) / ActVal sl t_del CU

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	5.00 [ms]	1000.00 [ms]	100.00 [ms]
Description:	Sets the delay time to evaluate the encoderless actual value sensing after the pulses have been enabled. The value must be greater than or equal to the motor magnetizing time (p0346).		
Dependency:	Refer to: C01711		
Caution:	The safety functionality is only completely guaranteed after this time has expired.		
			
Notice:	If this value is reduced, this can have a negative impact on the actual value acquisition and plausibility check – and result in Safety message C01711 with the message value 1041 or 1042.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The set time is rounded internally to an integer multiple of the monitoring clock cycle.		

p9587	SI Motion actual value sensing sensorless filter time (CU) / Actv sl t_filt CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	100.00 [ms]	25.00 [ms]
Description:	Sets the filter time for smoothing the actual value with sensorless actual value sensing.		
Notice:	A longer filter time results in a longer response time.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). The smoothing is realized with a 1st order lowpass filter For p9587 = minimum value, the filter is deactivated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.		
p9588	SI Motion actual value sensing sensorless minimum current (CU) / ActVal sl I_min CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [%]	1000.00 [%]	10.00 [%]
Description:	Sets the minimum current for encoderless actual value sensing referred to 1 A (i.e. 1 % = 10 mA). - the value must be increased if C01711 has occurred with message value 1042. - the value must be decreased if C01711 has occurred with message value 1041. For synchronous motors, the following condition must be fulfilled: $ p0305 \times p9783 \geq p9588 \times 1.2$		
Recommendation:	If required, the correct value of the motor minimum current should be determined by making the appropriate measurements.		
Dependency:	Refer to: r9785 Refer to: C01711		
Notice:	If this percentage value is reduced excessively, then this can result in a safety message and an inaccurate actual value.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).		
p9589	SI Motion act. value sensing sensorless acceleration limit (CU) / ActVal sl a_lim CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	10.00 [%]	3300.00 [%]	100.00 [%]
Description:	Sets the acceleration limit to filter velocity fluctuations. If this percentage value is increased, when accelerating, velocity peaks that do not reflect the real velocity characteristic can occur. If this value is decreased, and this dampens the velocity peaks when accelerating. - the value must be increased if C01711 with message value 1043 has occurred. - the value must be lowered if acceleration procedures have led to an excessive Safety actual velocity.		
Recommendation:	The setting of this parameter depends on the motor and closed-loop control, and must be newly determined for each configuration. To do this, a measurement should be performed while the actual value jumps, and the limit in r9785[0] must be set so low using p9589, so that it is exceeded by the value in r9785[1] a maximum of four times per second. The actual value correction filter intervenes at this instant in time. The step is no longer so drastic.		

Dependency: Refer to: r9784
Refer to: C01711

Note: This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3).
For p9589 = maximum value, the filter is deactivated.
Diagnostics parameter p9784 must be used to correctly set this parameter.

Description: Sets the enable signals for the safety functions integrated in the drive and the type of selection on the Control Unit. Not all of the settings listed below will be permissible, depending on the Control Unit and Motor Module or Power Module being used:

0000 hex:

Safety functions integrated in the drive inhibited (no safety function).

0001 hex:

Basic functions are enabled via onboard terminals (permissible for r9771.0 = 1).

0004 hex:

Extended functions via Terminal Module 54F (TM54F) have been enabled (permissible for r9771.5 = 1).

0005 hex:

Extended functions via Terminal Module 54F (TM54F) and the basic functions via onboard terminals have been enabled (permissible for r9771.5 = 1).

0008 hex:

Basic functions are enabled via PROFIsafe (permissible for r9771.6 = 1).

0009 hex:

Basic functions are enabled via PROFIsafe onboard terminals (permissible for r9771.6 = 1).

000C hex:

Extended functions are enabled via PROFIsafe (permissible for r9771.4 = 1).

000D hex:

Extended functions are enabled via PROFIsafe and basic functions via onboard terminals (permissible for r9771.4 = 1).

0024 hex:

Extended functions without selection are enabled (permissible for r9771.16 = 1).

0025 hex:

Extended functions without selection and basic functions via onboard terminals are enabled (permissible for r9771.16 = 1).

Description: Sets the enable signal for the function "Safe Brake Control" (SBC) on the Control Unit.

Value:
0: Inhibit SBC
1: Enable SBC

Dependency: Refer to: p9802

Note: The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0).

It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake.

The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible.

Dependency:	Refer to: p9601		
Note:	The following signal sources are permitted: - fixed zero (standard setting). - digital inputs DI 0 ... 7, 16, 17, 20, 21 on the Control Unit 320-2 (CU320-2). - digital inputs DI 0 ... 3, 16, 17 on the Controller Extensions (CX32-2, NX10.3, NX15.3). - digital inputs DI 0 ... 3, 16 on the Control Unit 310-2 (CU310-2). It is not permitted to establish an interconnection to a digital input in the simulation mode. For a parallel circuit configuration of n power units, the following applies: p9620[0] = Signal source for power unit 1 ... p9620[n-1] = Signal source for power unit n		

p9621	BI: SI Safe Brake Adapter signal source (Control Unit) / SI SBA S_src CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32 / Binary	Dyn. index: -	Func. diagram: 2814
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	0
Description:	Sets the signal source for Safe Brake Adapter (SBA). This defines via which digital input the Safe Brake Adapter feedback signal is read-in (SBA_DIAG). p9621/p9821 = 0: There is no Safe Brake Control (SBC) with Safe Brake Adapter (SBA) available. p9621/p9821 = r0722.x (x = 0, 1 ... 7) Safe Brake Adapter and Booksize unit (no Communication Interface Module (CIM)). p9621/p9821 = r9872.3 Safe Brake Adapter and Chassis unit (CIM).		
Dependency:	Refer to: p9601, p9602, p9821		
Note:	No difference is tolerated for a data cross-check between p9621 and p9821. To use the "Safe Brake Adapter" function the following must apply: p9601 = p9801 <> 0 and p9602 = p9802 = 1		

p9622[0...1]	SI SBA relay delay times (Control Unit) / SI SBA relay t CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3

	Min	Max	Factory setting
	0.00 [ms]	1000.00 [ms]	[0] 100.00 [ms] [1] 65.00 [ms]
Description:	Sets the delay times for activating and deactivating the Safe Brake Adapter relay. The relay-specific minimum delay times for evaluating the feedback signal contacts have to be set. They differ for the activation and deactivation of one and the same relay.		
Index:	[0] = Wait time activation [1] = Wait time deactivation		
Dependency:	Refer to: p9822		
Note:	For a data cross-check between p9622 and p9822, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. For index [0]: Wait time switch on = drop-out time + bounce time NO contact + effect of the free-wheeling diode in the Safe Brake Adapter For index [1]: Wait time switch off = response time + bounce time NC contact + effect of the free-wheeling diode in the Safe Brake Adapter		
p9650	SI SGE changeover discrepancy time (Control Unit) / SI SGE chg t CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 2810
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	2000.00 [ms]	500.00 [ms]
Description:	Sets the discrepancy time to change over the safety-related inputs (SGE) on the Control Unit. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.		
Dependency:	Refer to: p9850		
Note:	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)		
p9651	SI STO/SBC/SS1 debounce time (Control Unit) / SI STO t_debou CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	100.00 [ms]	0.00 [ms]
Description:	Sets the debounce time for the failsafe digital inputs used to control STO/SBC/SS1.		
Notice:	To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]: - if p0799[0] is less than 1 ms, then p9651 = 1 ms or a multiple integer of 1 ms. - if p0799[0] is greater or equal to 1 ms, then p9651 must = p0799[0] - or must be a multiple integer of p0799[0].		
Note:	The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions.		

2 Parameters

2.2 List of parameters

Example:

Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.

Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

The set debounce time impacts the response time of the safety function.

p9652	SI Safe Stop 1 delay time / SI Stop 1 t_{del}		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [s]	300.00 [s]	0.00 [s]
Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Control Unit to brake along the OFF3 down ramp (p1135).		
Recommendation:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9852		
Note:	Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9612 = 1). For a data cross-check between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SS1: Safe Stop 1		

p9653	SI Safe Stop 1 drive-based braking response / SI SS1 drv resp		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Integer16	Dyn. index: -	Func. diagram: -
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0
Description:	Sets the drive-based braking response for the "Safe Stop 1" (SS1) function.		
Value:	0: SS1 with OFF3 1: SS1E external stop		
Note:	SS1: Safe Stop 1 SS1E: Safe Stop 1 external (Safe Stop 1 with external stop) SS1E requires the externally initiated stop in order to be in conformance with stop Category 1. With this parameter, a switchover is made from SS1 to SS1E, and the drive-based braking response of function SS1 (time controlled) of the Basic Functions is deactivated.		

p9658	SI transition time STOP F to STOP A (Control Unit) / SI STOP F->A CU		
VECTOR_G	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 2802
	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	30000.00 [ms]	0.00 [ms]
Description:	Sets the transition period from STOP F to STOP A on the Control Unit.		
Dependency:	Refer to: r9795, p9858 Refer to: F01611		

Note: For a data cross-check between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated. The set time is rounded internally to an integer multiple of the monitoring clock cycle.

If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time.

STOP F: Defect in a monitoring channel (error in the data cross-check)
 STOP A: STO as a result of a fault detected by Safety Integrated

Description:	Sets the signal source for the test stop of the safe motion monitoring functions.		
Notice:	Before setting the signal source in p9705 it must be ensured that the signal source is at a logical 0. If, in the Safety commissioning mode, the signal source in p9705 is set - and it already has a logical 1 - then a test stop is immediately initiated and the messages C01711/C30711 are output with message value 1005.		
Note:	It is not permissible to use TM54F inputs to start the test stop.

Note: Regarding the units, this parameter should be interpreted as follows:
 - linear axis: μm
 - rotary axis: mdegrees
 The value of this parameter is displayed in r9708 with units (mm or degrees).
 The display is updated in the safety monitoring clock cycle.

For index [0]:

The display of the load-side position actual value on the Control Unit is updated in the monitoring clock cycle.

For index [1]:

The display of the load-side position actual value on the second channel is updated in the KDV clock cycle (r9724) and delayed by one KDV clock cycle.

The maximum difference between the load-side position actual value on the Control Unit and the load-side position actual value on the second channel.

For index [4]:

Displays the load-side position actual value when enabling the function "Safe position via PROFIsafe".

The value is an average value from the values in index 0 and 1.

For a 16-bit notation, the value is influenced using the scaling factor (p9574/p9374).

When the function is not enabled, the content corresponds to the value in index 0.

For index [5]:

The display of the maximum additional difference between the load-side position actual value on the Control Unit, and the load-side position actual value in the second channel, which can occur as a result of the actual value sensing delay in the EnDat 2.2 converter.

Input in p9542: r9713[3] + r9713[5], after performing the measurement for the mechanical tolerance by performing a test run, where, after completion, the maximum tolerance that has occurred is displayed in r9713[3].

Description:	Displays the safe maximum velocity (on the load side) that is permissible for the safe motion monitoring functions as a result of the actual value sensing. This parameter indicates up to which load velocity the safe encoder actual values (redundant encoder coarse position) can still be correctly detected as a result of the particular encoder parameterization. This parameter is only of significance for enabled safety with encoder (otherwise "0").

Description:	Displays the velocity resolution for safety-relevant motion monitoring functions. For index [0]: Displays the safe velocity resolution (load side). Setpoints for velocity limits or parameter changes for velocities below this threshold have no effect.		

	For index [1]: Displays the safe velocity accuracy based on the safe encoder accuracy
Index:	[0] = Actual velocity resolution [1] = Minimum velocity resolution
Note:	For index [0]: This parameter does not provide any information about the actual accuracy of the velocity sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi) to mm/min (linear) or rpm (rotary) with Tsi = p9500 (SI Motion monitoring clock cycle). Example: For Tsi = 12 ms, r9732[0] = 5 mm/min (linear) or 1/72 rpm (rotary) is obtained. For index [1]: - for a 2-encoder system with non safety-capable encoders, this means the poorer value for both encoders. Index[1] takes into account the coarse resolution of the encoder only Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result returns mm/min (linear) or rpm (rotary). - for safety without encoder, index 1 is not relevant, and is always the value of zero.

r9733[0...2]	CO: SI Motion setpoint speed limit effective / SI Mtn setp_lim		
VECTOR_G	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dyn. index: -	Func. diagram: 2820, 2824, 3630
	P-Group: Safety Integrated	Unit group: 3_1	Unit selection: p0505
	Not for motor type: -	Scaling: p2000	Expert list: 1
	Min	Max	Factory setting
	- [rpm]	- [rpm]	- [rpm]
Description:	Displays the necessary setpoint speed limit as a result of the selected motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.		
Recommendation:	For the ramp-function generator, by appropriately interconnecting the speed limits p1051 and p1052 with r9733[0, 1], a drive-based setpoint velocity limiting can be realized. - CI: p1051 = r9733[0] - CI: p1052 = r9733[1] Additional limiting can also be activated using connector input p1085 and p1088.		
Index:	[0] = Setpoint limiting positive [1] = Setpoint limiting negative [2] = Setpoint limit absolute		
Dependency:	For SLS: r9733[0] = p9531[x] x p9533 (converted from the load side to the motor side) For SDI negative: r9733[0] = 0 For SLS: r9733[1] = - p9531[x] x p9533 (converted from the load side to the motor side) For SDI positive: r9733[1] = 0 [x] = Selected SLS stage Conversion factor from the motor side to the load side: - motor type = rotary and axis type = linear: p9522 / (p9521 x p9520) - otherwise: p9522 / p9521 Refer to: p9531, p9533		
Notice:	If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected and vice versa. If only the absolute value of the setpoint velocity limiting is required, r9733[2] must be interconnected.		
Note:	The unit changeover between linear and rotary axis is not implemented via the safety changeover (p9502) but by the linear motor changeover. If the "SLS" or "SDI" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082. The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722. When selecting SOS or a STOP A ... D, setpoint 0 is specified in r9733.

2 Parameters

2.2 List of parameters

Dependency: Refer to: r9872

Note: For bit 00:
When STO or "Safe pulse cancellation" is selected, the cause is displayed in bits 16 ... 21.
For bit 01:
- For p9772.1 = 1 and p9772.19 = 0, an STO from the Safety Basic functions is active.
- For p9772.1 = 1 and p9772.19 = 1, safe pulse cancellation is active, if safety functions without selection are activated via p9601.2/p9801.2 = 1 and p9601.5/p9801.5 = 1.
Note:
If p9601.0 = 1 and p9601.2 = 1 and p9801.5 = 1 then for bit 0 and 1, the STO function applies.
For bit 05:
When SS1 is selected, the cause is displayed in bits 22 and 23.
For bit 18:
When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).
For bit 19:
With SMM encoderless no actual value sensing is possible on account of OFF2.
With SMM with encoder no actual value sensing is possible on account of parking.
For Safety functions without selection, safe pulse cancellation to selected (p9772.19 = 1).
SMM: Safe Motion Monitoring
For bit 22 and 23:
These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.
If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description: Display and BICO output for the Safety Integrated status of the group to which this drive belongs.

These signals are an AND logic operation of the individual status signals of the drives included in this group.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	STO selected in group	Yes	No	2804
	01	STO active in group	Yes	No	2804
	02	SS1 delay time active in group	Yes	No	-

05	SS1 selected in group (Basic Functions)	Yes	No	-
06	SS1 active in group (Basic Functions)	Yes	No	-
31	Switch-off signal paths of the group must be tested	Yes	No	2804

Dependency: Refer to: p9620, r9773

Notice: If a drive belonging to a group is deactivated via p0105, then the signals in r9774 can no longer be correctly displayed (Remedy: Before deactivating, remove this drive from the group).

Note: A group is formed by appropriately grouping the terminals for the function "Safe Torque Off" (STO).
The status of a group of n drives is, for drives 1 to n - 1 displayed with a delay of one monitoring clock cycle; this is a system-related effect.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-50.00 [%]	0.00 [%]	-20.00 [%]
Description:	Sets the additional field-generating current for synchronous motors with sensorless actual value sensing. The set value is referred to p0305. This parameter ensures a "base load" for the motor. The value must fulfill the following condition: p0305 x p9783 >= p9588 x 1.2		
Dependency:	Refer to: p9588 Refer to: C01711		
Notice:	Reducing this percentage value can adversely affect actual value sensing with synchronous motors. If the value is increased, this results in an increased motor power loss.		
Note:	This parameter is only effective for encoderless actual value sensing (p9506/p9306 = 1, 3). For p9783 = maximum value, current injection is deactivated. Current injection is not effective in the U/f control mode.

Description:	Displays the acceleration resolution (load side) for the "SLA" function. Setpoints for acceleration limits or parameter changes for acceleration levels below this threshold have no effect.		
Index:	[0] = Coarse resolution [1] = Fine resolution		
Note:	This parameter does not provide any information about the actual accuracy of the acceleration sensing. This depends on the type of actual value sensing, the gear factors as well as the quality of the encoder being used. Conversion of: (internal fixed value/ Tsi ²) to m/s ² (linear) or 1/s ² (rotary) with Tsi = p9500 (SI motion monitoring clock cycle) Example: For Tsi = 12 ms, r9790[0] = 0.006944 m/s ² (linear) or 0.019290 1/s ² (rotary) is obtained. For Tsi = 12 ms, r9790[1] = 0.000006944 m/s ² (linear) or 0.000019290 1/s ² (rotary) is obtained. Internal calculation, which also incorporates the factor for the motor-load side conversion, the gearbox ratio and the safety monitoring clock cycle. Result for a coarse resolution is 0.006944 m/s ² (linear) - or 0.019290 1/s ² (rotary). Result for a fine resolution is 0.000006944 m/s ² (linear) - or 0.000019290 1/s ² (rotary). Description:	Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module. 0: Inhibit SBC 1: Enable SBC		
Dependency:	Refer to: p9602		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. The parameterization "motor holding brake without feedback signals" and "Safe Brake Control" enabled (p1278 = 1, p9602 = 1, p9802 = 1) is not permissible. Description:	Sets the stop response when PROFIsafe communication fails.			
Value:	0: STOP A 1: STOP B			
Dependency:	Refer to: p9612			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	For the selected STOP B stop response, in order to ensure that the OFF3 ramp is actually maintained, when just using the Safety Basic Functions, the following must be carefully observed: - the transition time STOP F to STOP A (p9658, p9858) must be set longer or equal to the SS1 delay time (p9652, p9852). - if a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119).

Description:	Sets the signal source for Safe Brake Adapter (SBA). This defines via which digital input the Safe Brake Adapter feedback signal is read-in (SBA_DIAG). p9621/p9821 = 0: There is no Safe Brake Control (SBC) with Safe Brake Adapter (SBA) available. p9621/p9821 = r0722.x (x = 0, 1 ... 7) Safe Brake Adapter and Booksize unit (no Communication Interface Module (CIM)). p9621/p9821 = r9872.3 Safe Brake Adapter and Chassis unit (CIM).		
Dependency:	Refer to: p9601, p9602, p9621		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	No difference is tolerated for a data cross-check between p9621 and p9821. To use the "Safe Brake Adapter" function the following must apply: p9601 = p9801 <> 0 and p9602 = p9802 = 1

	0.00 [µs]	1000000.00 [µs]	[0] 100000.00 [µs] [1] 65000.00 [µs]
Description:	Sets the delay times for activating and deactivating the Safe Brake Adapter relay. The relay-specific minimum delay times for evaluating the feedback signal contacts have to be set. They differ for the activation and deactivation of one and the same relay.		
Index:	[0] = Wait time activation [1] = Wait time deactivation		
Dependency:	Refer to: p9622		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The set time is rounded internally to an integer multiple of the monitoring clock cycle. For index [0]: Wait time switch on = drop-out time + bounce time NO contact + effect of the free-wheeling diode in the Safe Brake Adapter For index [1]: Wait time switch off = response time + bounce time NC contact + effect of the free-wheeling diode in the Safe Brake Adapter

	Min	Max	Factory setting
	0.00 [µs]	2000000.00 [µs]	500000.00 [µs]
Description:	Sets the discrepancy time to change over the safety-related inputs (SGE) on the Motor Module/Hydraulic Module. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this discrepancy time.		
Dependency:	Refer to: p9650		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)

	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [µs]	100000.00 [µs]	0.00 [µs]
Description:	Sets the debounce time for the EP terminal of the Motor Module.		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	Rounding effects can occur in the last decimal place of the parameterized time. The debounce time is rounded to whole milliseconds. It specifies the maximum duration of a fault pulse at the failsafe digital inputs with no reaction/influence on the selection or deselection of the Safety Basic Functions. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

	P-Group: Safety Integrated	Unit group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.00 [ms]	300000.00 [ms]	0.00 [ms]
Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).		
Recommendation:	In order that the drive can completely ramp-down along the OFF3 ramp and a motor holding brake that is possibly available can close, then the delay time should be set as follows: Motor holding brake parameterized: delay time \geq p1135 + p1228 + p1217 Motor holding brake not parameterized: delay time \geq p1135 + p1228		
Dependency:	Refer to: p1135, p9652		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	Pulse cancellation after failure of PROFIsafe communication is delayed by this time if "STOP B" is set (p9812 = 1). For a data cross-check between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. SS1: Safe Stop 1

	0.00 [µs]	30000000.00 [µs]	0.00 [µs]	
Description:	Sets the transition period from STOP F to STOP A on the Motor Module/Hydraulic Module.			
Dependency:	Refer to: p9658, r9895 Refer to: F30611			
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.			
Note:	For a data cross-check between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated. Rounding effects can occur in the last decimal place of the parameterized time. The set time is rounded internally to an integer multiple of the monitoring clock cycle. If a higher-level control responds to a drive fault by withdrawing the controller enable signals, for faults F01611 and F30611, the message type must be changed to alarm (p2118, p2119). As a consequence, the drive can still be braked in a controlled fashion during this delay time. STOP F: Defect in a monitoring channel (error in the data cross-check) STOP A: STO as a result of a fault detected by Safety Integrated

2 Parameters

2.2 List of parameters

Note: The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Article No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Article Number

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

Description:

For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion.

For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned:

- component type (e.g. "SMC20")
- article number (e.g. "6SL3055-0AA0-5BA0")

For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.

Dependency:

Refer to: p9904, p9905

Note:

The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON).

Special case for Control Unit and option slot modules:

When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Notice:	An ASCII table (excerpt) can be found, for example, in the appendix to the List Manual. With the STARTER commissioning tool, the ASCII characters are not entered coded, i.e. the license key characters can be entered as printed in the Certificate of License. In this case, the commissioning tool codes the characters.		
Note:	For an invalid license key, all the indices have the value 0 dec. Only the ASCII characters contained in a license key can be entered ("1" to "9", "A" to "H", "K" to "N", "P" to "Z" as well as "-"). When manually changing p9920[x] to the value 0 dec, all the values of all the following indices are also set to 0 dec. After entering the license key, the license key must be activated (p9921).		

The following fault and LED indicate that the licensing is not adequate:

Description:

Deselection and selection of topology rules of the auto commissioning using p97 and p9910.

Bit 0 permits auto commissioning if DRIVE-CLiQ motors are connected to a DMC20 / DME20.

Bit 1 results in the assignment of direct measuring systems, which are connected at the Control Unit or a DMC20 / DME20.

Bit 2 results in the parallel connection of several Active Line Modules if auto commissioning is realized with p97/p9910=1 or p97/p9910=2.

Dependency: Refer to: r7901, r9975, r9980
 Refer to: F01054

Note: The corresponding sampling times can be read out in parameter r7901.
 Net utilization:
 Computing time load that is only called by the sampling time involved.
 Total utilization:
 Computing time load of sampling time involved including load from higher-priority sampling times (interrupts).

	0.00000 [ms]	25.00000 [ms]	[0] 12.00000 [ms] [1...5] 0.00000 [ms]

Description:

Sets the safety communication clock cycle with which the TM54F communicates with a drive.
 The communication clock cycle must correspond to the safety monitoring clock cycle of the drive.

Index:

[0] = Drive 1
 [1] = Drive 2
 [2] = Drive 3
 [3] = Drive 4
 [4] = Drive 5
 [5] = Drive 6

Note:

- if only index 0 of p10000 is used, then p10000[0] defines the communication clock cycle that is applicable for all drives used in p10010[]. In this case, all safety monitoring clock cycles on the Control Unit must be identical with p10000[0].
 - the minimum communication clock cycle is 1 ms.

p10001**SI TM54F wait time for test stop at DO 0 ... DO 3 / SI t_delay DO**

TM54F_MA, TM54F_SL	Can be changed: C2(95)	Calculated: -	Access level: 3

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	2.00 [ms]	2000.00 [ms]	500.00 [ms]

Description:

Sets the delay time for testing the digital outputs 0 ... 3 (DO 0 ... DO 3).
 Within this time, for a forced checking procedure of the digital outputs, the signal must have been detected via the corresponding readback input (p10047).

Dependency:

Refer to: p10003, p10007, p10041, p10046

Note:

The delay time must be set to a value greater than the debounce time (p10017).
 The set time is rounded internally to an integer multiple of the TM54F sampling time (r10015).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.00 [ms]	2000.00 [ms]	500.00 [ms]
Description:	Sets the discrepancy time for digital inputs. The signal states at the two associated digital inputs (F-DI) must assume the same state within this discrepancy time.		
Note:	The discrepancy time of the F-DIs must always be set higher than the highest value of parameter p9780 or p9500 of the drives that use safety with TM54F. The set time is rounded internally to an integer multiple of the TM54F sampling time (r10015).		
p10003	SI TM54F forced checking procedure timer / SI dyn t		
TM54F_MA	Can be changed: C2(95)	Calculated: -	Access level: 3

Description: Displays the active sampling time of the TM54F.
In this clock cycle, the debounced F-DIs (p10017) are evaluated, and converted over to SGEs.
In this clock cycle, also the F-DOs are controlled corresponding to the presently available SGAs.
This clock cycle corresponds to the smallest communication clock cycle that was entered in p10000[].
SGEs are transferred to the drives, and the SGAs received from the drives are transferred with the specific communication clock cycle of each drive in p10000[].
The value of a specific index of p10000[] represents the communication clock cycle of the drive, which is entered in the same index of p10010[].

Note: SGA: Safety-related output
SGE: Safety-relevant input

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	1.00 [ms]	100.00 [ms]	1.00 [ms]

Description: Sets the debounce time for digital inputs.
The debounce time is accepted rounded off to whole milliseconds.
The debounce time acts on the following digital inputs:
- Failsafe digital inputs (F-DI).
- Single-channel digital inputs (DI).

Notice: To filter noise pulses or test impulses from F-DOs, there is the following dependency on the parameter p0799[0]:
 - if p0799[0] is less than 1 ms, then p10017 = 1 ms or a multiple integer of 1 ms.
 - if p0799[0] is greater or equal to 1 ms, then p10017 must = p0799[0] - or must be a multiple integer of p0799[0].

Note: Example:
 Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed.
 Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.
 The debounce result can be read in r10051.
 The set debounce time impacts the response time of the safety function.

Note:	If a safety function is assigned to an input (e.g. via p10022), then the following applies: - logical "0": Safety function is selected - logical "1": Safety function is deselected The relationship between the logic level and the external voltage level at the input depends on the parameterization (see p10040) of the input as NC contact or NO contact, and is aligned to the use of a safety function: With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level. This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselected the safety function. With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level. This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselected the safety function. F-DI: Failsafe Digital Input

Description: Displays the events that lead to the transfer of failsafe signals to all drives assigned to the TM54F. If the second channel of the TM54F transmits failsafe signals, then these are synchronized to the other channel. In this particular case, p10054 of the other TM54F channel should be evaluated.

Possibilities of resolving the situation:

- test stop error: correctly perform the test stop.
- internal software error: no possibility of resolving this problem, POWER ON.
- internal synchronization problem: no possibility of resolving this problem, POWER ON.
- internal status error: no possibility of resolving this problem, POWER ON.
- parameterizing error: evaluate fault F35004 or F35006. Remove the parameterization error. POWER ON. After the TM54F firmware has been updated, a POWER ON may be required.
- all other causes: remove the cause of the error and carry out a safe acknowledgment (p10006).

r0146[0...n]	Encoder interface active/inactive / Enc_intf act/inact
r0147[0...n]	Sensor Module EEPROM data version / SM EEPROM version
r0148[0...n]	Sensor Module firmware version / SM FW version
p0400[0...n]	Encoder type selection / Enc_typ sel
p0402[0...n]	Gearbox type selection / Gearbox type sel
p0404[0...n]	Encoder configuration effective / Enc_config eff
p0405[0...n]	Square-wave encoder track A/B / Sq-wave enc A/B
p0407[0...n]	Linear encoder grid division / Enc grid div
p0408[0...n]	Rotary encoder pulse number / Rot enc pulse No.
p0410[0...n]	Encoder inversion actual value / Enc inv act value
p0411[0...n]	Measuring gear configuration / Meas gear config
p0412[0...n]	Measuring gear absolute encoder rotary revolutions virtual / Abs rot rev
p0413[0...n]	Measuring gear position tracking tolerance window / Pos track window
p0414[0...n]	Redundant coarse position value relevant bits (identified) / Relevant bits
p0415[0...n]	Gx_XIST1 Coarse position safe most significant bit (identified) / Gx_XIST1 safe MSB
p0416[0...n]	Non safety-relevant meas. steps position value POS1 (detected) / nsrPos1
p0417[0...n]	Encoder safety comparison algorithm (detected) / Safety comp_algo
p0418[0...n]	Fine resolution Gx_XIST1 (in bits) / Enc fine Gx_XIST1
p0419[0...n]	Fine resolution absolute value Gx_XIST2 (in bits) / Enc fine Gx_XIST2
p0420[0...n]	Encoder connection / Enc_connection
p0421[0...n]	Absolute encoder rotary multiturn resolution / Enc abs multiturn
p0422[0...n]	Absolute encoder linear measuring step resolution / Enc abs meas step
p0423[0...n]	Absolute encoder rotary singleturn resolution / Enc abs singleturn
p0424[0...n]	Encoder linear zero mark distance / Enc lin ZM_dist
p0425[0...n]	Encoder rotary zero mark distance / Enc rot dist ZM
p0426[0...n]	Encoder zero mark differential distance / Enc ZM Dif_dist
p0427[0...n]	Encoder SSI baud rate / Enc SSI baud rate
p0428[0...n]	Encoder SSI monoflop time / Enc SSI t_monoflop
p0429[0...n]	Encoder SSI configuration / Enc SSI config
p0430[0...n]	Sensor Module configuration / SM config
p0431[0...n]	Angular commutation offset / Ang_com offset
p0432[0...n]	Gearbox factor encoder revolutions / Grbx_fact enc_rev
p0433[0...n]	Gearbox factor motor/load revolutions / Gbx_fact mot/load
p0434[0...n]	Encoder SSI error bit / Enc SSI error bit
p0435[0...n]	Encoder SSI alarm bit / Enc SSI alarm bit
p0436[0...n]	Encoder SSI parity bit / Enc SSI parity bit
p0437[0...n]	Sensor Module configuration extended / SM config ext
p0438[0...n]	Squarewave encoder filter time / Enc t_filt
p0439[0...n]	Encoder ramp-up time / Enc ramp-up time
p0440[0...n]	Copy encoder serial number / Copy enc ser_no
p0441[0...n]	Encoder commissioning serial number part 1 / Enc comm ser_no 1
p0442[0...n]	Encoder commissioning serial number part 2 / Enc comm ser_no 2
p0443[0...n]	Encoder commissioning serial number part 3 / Enc comm ser_no 3
p0444[0...n]	Encoder commissioning serial number part 4 / Enc comm ser_no 4
p0445[0...n]	Encoder commissioning serial number part 5 / Enc comm ser_no 5
p0446[0...n]	Encoder SSI number of bits before the absolute value / Enc SSI bit before
p0447[0...n]	Encoder SSI number of bits absolute value / Enc SSI bit val

p0448[0...n]	Encoder SSI number of bits after the absolute value / Enc SSI bit after
p0449[0...n]	Encoder SSI number of bits filler bits / Enc SSI fill bits
p0453[0...n]	Pulse encoder evaluation zero speed measuring time / Enc_ev n_0 t_meas
p0454[0...n]	Sensor Module configuration extended Part 2 / SM config ext 2
p0493[0...n]	Zero mark selection input terminal / ZM_sel inp_term
p0494[0...n]	Equivalent zero mark input terminal / ZM_equiv inp_term
p4600[0...n]	Motor temperature sensor 1 sensor type / Temp_sens 1 type
p4601[0...n]	Motor temperature sensor 2 sensor type / Temp_sens 2 type
p4602[0...n]	Motor temperature sensor 3 sensor type / Temp_sens 3 type
p4603[0...n]	Motor temperature sensor 4 sensor type / Temp_sens 4 type
p4630[0...n]	Absolute encoder linear measuring step factor / Abs_enc meas fact
p4649[0...n]	Encoder function reserve amplitude limit incremental signals / Enc fct amp inc
p4662[0...n]	Encoder characteristic type / Enc char_type
p4663[0...n]	Encoder characteristic K0 / Enc char K0
p4664[0...n]	Encoder characteristic K1 / Enc char K1
p4665[0...n]	Encoder characteristic K2 / Enc char K2
p4666[0...n]	Encoder characteristic K3 / Enc char K3
p4670[0...n]	Analog sensor configuration / Ana_sens config
p4671[0...n]	Analog sensor input / Ana_sens inp
p4672[0...n]	Analog sensor channel A voltage at actual value zero / Ana_sens A U at 0
p4673[0...n]	Analog sensor channel A voltage per encoder period / Ana_sens A U/per
p4674[0...n]	Analog sensor channel B voltage at actual value zero / Ana_sens B U at 0
p4675[0...n]	Analog sensor channel B voltage per encoder period / Ana_sens B U/per
p4676[0...n]	Analog sensor range limit threshold / Ana_sens lim thr
p4677[0...n]	Analog sensor LVDT configuration / Ana_sens LVDT conf
p4678[0...n]	Analog sensor LVDT ratio / An_sens LVDT ratio
p4679[0...n]	Analog sensor LVDT phase / An_sens LVDT ph
p4680[0...n]	Zero mark monitoring tolerance permissible / ZM_monit tol perm
p4681[0...n]	Zero mark monitoring tolerance window limit 1 positive / ZM tol lim 1 pos
p4682[0...n]	Zero mark monitoring tolerance window limit 1 negative / ZM tol lim 1 neg
p4683[0...n]	Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos
p4684[0...n]	Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg
p4685[0...n]	Speed actual value mean value generation / n_act mean val
p4686[0...n]	Zero mark minimum length / ZM min length

p0369[0...n]	Motor saturation characteristic I_mag 4 / Mot sat. I_mag 4
r0370[0...n]	Motor stator resistance cold / Mot R_stator cold
r0372[0...n]	Total power unit cable resistance / PU cable R tot
r0373[0...n]	Motor rated stator resistance / Mot R_stator rated
r0374[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R_r cold/R_D d
r0375[0...n]	Motor damping resistance q axis / Mot R_damp q
r0376[0...n]	Rated motor rotor resistance / Mot rated R_rotor
r0377[0...n]	Motor leakage inductance total / Mot L_leak total
r0378[0...n]	Motor stator inductance d axis / Mot L_stator d
r0380[0...n]	Motor damping inductance d axis / Mot L_damp d
r0381[0...n]	Motor damping inductance q axis / Mot L_damp q
r0382[0...n]	Motor magnetizing inductance transformed / Lh d axis saturated / Mot L_m tr/Lhd sat
r0383[0...n]	Motor magnetizing inductance q axis saturated / Mot L_magn q sat
r0384[0...n]	Motor rotor time constant / damping time constant d axis / Mot T_rotor/T_Dd
r0385[0...n]	Motor damping time constant q axis / Mot L_damping q
r0386[0...n]	Motor stator leakage time constant / Mot T_stator leak
r0387[0...n]	Motor stator leakage time constant q axis / Mot T_Sleak /T_Sq
p0389[0...n]	Excitation rated no-load current / Exc I_noload_rated
p0390[0...n]	Rated excitation current / Exc I_rated
p0391[0...n]	Current controller adaptation starting point Kp / I_adapt pt Kp
p0392[0...n]	Current controller adaptation starting point Kp adapted / I_adapt pt Kp adap
p0393[0...n]	Current controller adaptation P gain scaling / I_adapt Kp scal
r0395[0...n]	Actual stator resistance / R_stator act
r0396[0...n]	Actual rotor resistance / R_rotor act
p0397[0...n]	Angle magnetic decoupling maximum angle / Magn decpl max_ang
p0398[0...n]	Angle magn decoupling (cross saturation) coeff 1 / Magn decoupl C1
p0399[0...n]	Angle magn decoupling (cross saturation) coeff 3 / Magn decoupl C3
p0530[0...n]	Bearing version selection / Bearing vers sel
p0531[0...n]	Bearing code number selection / Bearing codeNo sel
p0532[0...n]	Bearing maximum speed / Bearing n_max
p0600[0...n]	Motor temperature sensor for monitoring / Mot temp_sensor
p0601[0...n]	Motor temperature sensor type / Mot_temp_sens type
p0604[0...n]	Mot_temp_mod 2: sensor alarm threshold / Mod 2: sens A_thr
p0605[0...n]	Mot_temp_mod 1/2 sensor threshold and temperature value / Mod 1/2 sens thr_T
p0606[0...n]	Mot_temp_mod 2: sensor timer / Mod 2:sens timer
p0607[0...n]	Temperature sensor fault timer / Sensor fault time
p0610[0...n]	Motor overtemperature response / Mot temp response
p0611[0...n]	I2t motor model thermal time constant / I2t mot_mod T
p0612[0...n]	Mot_temp_mod activation / Mot_temp_mod act
p0613[0...n]	Mot_temp_mod 1/3 ambient temperature / Mod 1/3 amb_temp
p0614[0...n]	Thermal resistance adaptation reduction factor / Therm R_adapt red
p0615[0...n]	Mot_temp_mod 1 (I2t) fault threshold / I2t F thresh
p0616[0...n]	Motor overtemperature alarm threshold 1 / Mot temp alarm 1
p0620[0...n]	Thermal adaptation, stator and rotor resistance / Mot therm_adapt R
p0621[0...n]	Identification stator resistance after restart / Ident rst restart
p0622[0...n]	Motor excitation time for Rs_ident after switching on again / t_excit Rs_id

2.4 Parameters for write protection and know-how protection

2.4.1 Parameters with "WRITE_NO_LOCK"

The following list contains the parameters with the "WRITE_NO_LOCK" attribute.

These parameters are not affected by the write protection.

Product: SINAMICS G130/G150, Version: 5202300, Language: eng, Type: WRITE_NO_LOCK

p0003	BOP access level / BOP acc_level
p0009	Device commissioning parameter filter / Dev comm par_filt
p0124[0...n]	Main component detection using LED / M_comp detect LED
p0124[0...n]	Power unit detection via LED / PU detection LED
p0144[0...n]	Sensor Module detection via LED / SM detection LED
p0154	Terminal Module detection via LED / TM detection LED
p0154	DRIVE-CLiQ Hub Module detection via LED / Hub detection LED
p0972	Drive unit reset / Drv_unit reset
p0976	Reset and load all parameters / Reset load all par
p0977	Save all parameters / Save all par
p2035	Fieldbus interface USS PIV drive object number / Fieldbus USS DO_no
p2102	BI: Acknowledge all faults / Ackn all faults
p2111	Alarm counter / Alarm counter
p3100	RTC time stamp mode / RTC t_stamp mode
p3101[0...1]	Setting UTC time / Set UTC time
p3103	UTC synchronization process / UTC sync_process
p3950	Service parameter / Serv par
p3981	Acknowledge drive object faults / Ackn DO faults
p3985	Master control mode selection / PcCtrl mode select
p4700[0...1]	Trace control / Trace control
p4701	Measuring function control / Meas fct ctrl
p4703[0...1]	Trace options / Trace options
p4707	Measurement function configuration / Meas fct config
p4710[0...1]	Trace trigger condition / Trace Trig_cond
p4711[0...5]	Trace trigger signal / Trace trig_signal
p4712[0...1]	Trace trigger threshold / Trace trig_thresh
p4713[0...1]	Trace tolerance band trigger threshold 1 / Trace trig thr 1
p4714[0...1]	Trace tolerance band trigger threshold 2 / Trace trig thr 2
p4715[0...1]	Trace bit mask trigger, bit mask / Trace trig mask
p4716[0...1]	Trace bit mask trigger trigger condition / Trace Trig_cond
p4717	Measuring function number of averaging operations / Meas fct avg qty
p4718	Measuring function number of stabilizing periods / MeasFct StabPerQty
p4720[0...1]	Trace recording cycle / Trace record_cyc
p4721[0...1]	Trace recording time / Trace record_time
p4722[0...1]	Trace trigger delay / Trace trig_delay
p4723[0...1]	Trace time slice cycle / Trace cycle
p4724[0...1]	Trace average in the time range / Trace average
p4730[0...5]	Trace record signal 0 / Trace record sig 0
p4731[0...5]	Trace record signal 1 / Trace record sig 1
p4732[0...5]	Trace record signal 2 / Trace record sig 2
p4733[0...5]	Trace record signal 3 / Trace record sig 3
p4734[0...5]	Trace record signal 4 / Trace record sig 4
p4735[0...5]	Trace record signal 5 / Trace record sig 5
p4736[0...5]	Trace record signal 6 / Trace record sig 6
p4737[0...5]	Trace record signal 7 / Trace record sig 7

Data sets		Information on parameters, binectors, connectors					
Symbol	Meaning	Symbol	Meaning				
pxxxx[C]	Parameter belongs to the Command Data Set (CDS).	Parameter name	Parameter name (up to 18 characters).				
pxxxx[D]	Parameter belongs to the Drive Data Set (DDS).	[Unit]	[dimension unit] rotatory axis, for linear axis see list of parameters.				
pxxxx[E]	Parameter belongs to the Encoder Data Set (EDS).	rxxx[y] or rxxx[y...z] or rxxx[y].ww or rxxx.ww	"r" = monitoring parameter. These parameters are read-only "xxxx" stands for the parameter number, "y" specifies the valid index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[M]	Parameter belongs to the Motor Data Set (MDS).	pxxxx[y] or pxxxx[y...z] or pxxxx[y].ww or pxxxx.ww	"p" = setting parameter. These parameters can be changed. "xxxx" stands for the parameter number, "y" specifies the applicable index, "y...z" specifies the applicable index range ".ww" specifies the bit number (e.g. 0...15).				
pxxxx[P]	Parameter belongs to the Power unit Data Set (PDS).	from ... to	Value range.				
		(xxxx[y].ww)	Parameter number (xxxx) with Index number [y] and bit number .ww.				
		(Def)	Factory setting.				
		(Def.w)	Factory setting with bit number as prefix.				
		[aaaa.b]	Diagram references for setting parameters that occur a multiple number of times. [Function diagram number, signal path]				
		Samplings times					
		pxxxx[Y] (ZZZ.ZZ μs)	Setting parameter with factory setting to select the time slice.				
		p0115[y] (Drive Object)	Time slice depending on the pre-setting p0112 of the drive object. "y" specifies the applicable index.				
		p0115[y] (Motor Modules)	Time slice depending on the rated pulse frequency of the motor module. "y" specifies the applicable index.				
		PROFIdrive sampling time	Presetting for IF1 in p2048. Presetting for IF2 in p8848. The bus clock applies to a clock synchronized operate to IF1 or IF2.				
		CAN bus sampling time	Presetting in p8848.				
		Background	There is no fixed sampling time for this function. The processing takes place in background. The cycle time depends on the computational load of the control unit.				
		Not relevant	A static state is displayed here. The sampling time data is not relevant.

Fig. 3-4 1030 – Handling BICO technology

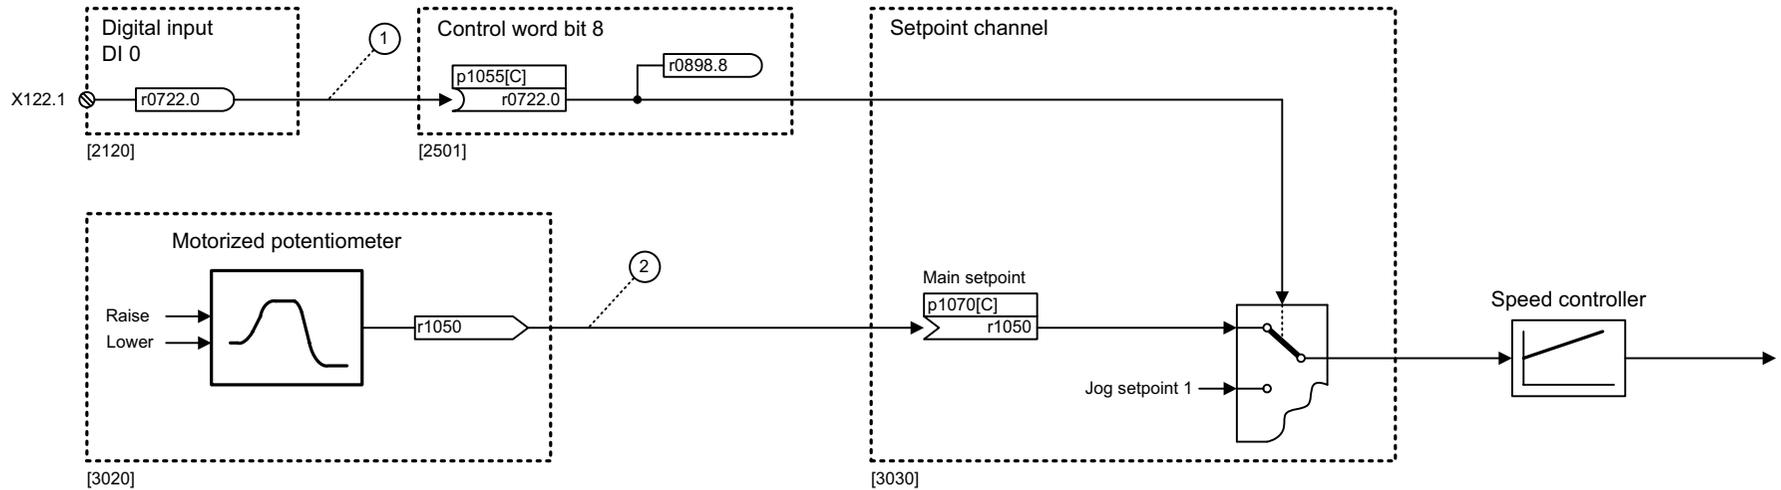

Handling BICO technology

Binector:  Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector:  Connectors are bit fields or numerical values that can be freely interconnected (e.g. "analog signals", like percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:
At the signal destination, the required binector or connector is selected using appropriate parameters:
"BI:" parameter for binectors (BI = Binector Input)
or
"CI:" parameter for connectors (CI = Connector Input)

Example:
The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

- Parameterizing steps:**
- 1 p1055[0] = r0722.0 Terminal X122.1 acts as "Jog bit 0".
 - 2 p1070[0] = r1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

- <1> Motor holding brake configuration (p1215)
0 = No motor holding brake being used.
1 = Motor holding brake acc. to sequence control.
2 = Motor holding brake always released.
3 = Motor holding brake like sequence control, connection via BICO.
- <2> Priority assignment (high -> low): p1215, p0858, p0855, p0856, sequence control.
- <3> If p1215 = 0, 2 -> t = 0 ms.
- <4> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
- <5> For p1227 = 300 s, the monitoring function is deactivated.
- <6> If an external motor holding brake is used, p1215 should be set to 3 and r0899.12 should be interconnected as control signal.
- <7> r0046.21 = 0, as long as r0046.0 = 1 (OFF1 enable missing or power-on inhibit).
The signal generation is shown simplified.
- <8> The internal signal includes signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
- <9> If the brake is permanently applied or released (p0855, p0858 or p1215), the drive does not wait while the brake is released or applied.
- <10> Only for SINAMICS S120.

Note: Braking signal diagnostic evaluation (p1278) only applies for SBC (Safe Brake Control) (controls the Safe Brake Relay). <10>
Note: With VECTOR with activated "parallel circuit" Function Module (r0108.15 = 1), the holding brake may only be connected to a power unit (p7015).

Fig. 3-76 2711 – Extended brake control, signal outputs (r0108.14 = 1)

<1> This pulse enable path only works for operation with brake (p1215 > 0).
 <2> For brakes with one single checkback signal, the inverted signal has to be interconnected to the BICO input for the second checkback. The switching times of the brake are set in p1216 and p1217.
 <3> Only if Safety Integrated is active (Double Motor Module: X22, Chassis: X41).
 <4> If an external motor holding brake is used, p1215 should be set to 3 and r1229.1 should be used as control signal.
 <5> The internal signal comprises signals that lead to OFF1 or OFF3 (e.g. BICO or fault response).
 <6> If the function module "extended brake control" is active (r0108.14 = 1), r1229.1 should be interconnected as control signal.
 <7> Only for SINAMICS S120 booksize.
 <8> Only for SINAMICS S120 Chassis/S150/G130/G150.
 Note: Braking signal diagnostic evaluation (p1278) is only relevant for SBC (Safe Brake Control) (controls the Safe Brake Relay). <7>

 KTY, PT100, PT1000: 0 ≙ The output of the timer is always switched out (logical 0)
 PTC: 0 ≙ Delay time = 0 s
 <2> The switch-in delay p0607 = 0 suppresses fault F07016.

4.1 Overview of faults and alarms

4.1.1 General information on faults and alarms

Display of faults/alarms (messages)

In the case of a fault, the drive signals the corresponding fault(s) and/or alarm(s).

For example, the following methods for displaying faults and alarms are available:

- Display via the fault and alarm buffer with PROFIBUS/PROFINET.
- Display online using the commissioning software.

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 4-1 Differences between faults and alarms

Type	Description
Faults	<p>What happens when a fault occurs?</p> <ul style="list-style-type: none"> • The appropriate fault reaction is triggered. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. <p>How are faults eliminated?</p> <ul style="list-style-type: none"> • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	<p>What happens when an alarm occurs?</p> <ul style="list-style-type: none"> • Status signal ZSW1.7 is set. • The alarm is entered in the alarm buffer. <p>How are alarms eliminated?</p> <ul style="list-style-type: none"> • Alarms acknowledge themselves. If the cause of the alarm is no longer present, it automatically reset itself.

Fault reactions

Note

The following table lists all fault reactions and their meanings used for the entire SINAMICS drive family.

The following fault reactions are defined:

Table 4-2 Fault reactions

List	PROFIdrive	Reaction	Description
NONE	-	None	<p>No reaction when a fault occurs.</p> <p>Note</p> <p>When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies:</p> <p>When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.</p>

Fault buffer - saved when switching off

The contents of the fault buffer are saved to the non-volatile memory when the Control Unit is switched off, i.e. the fault buffer history is still available when the unit is switched on again.

The fault buffer of a drive object comprises the following parameters:

- r0945[0...63], r0947[0...63], r0948[0...63], r0949[0...63]
- r2109[0...63], r2130[0...63], r2133[0...63], r2136[0...63]

The fault buffer contents can be deleted manually as follows:

- Delete fault buffer for all drive objects:
p2147 = 1 --> p2147 = 0 is automatically set after execution.
- Delete fault buffer for a specific drive object:
p0952 = 0 --> The parameter belongs to the specified drive object.

The fault buffer contents are automatically deleted when the following occurs:

- Restore factory setting (p0009 = 30 and p0976 = 1).
- Download with modified structure (e.g. number of drive objects changed).
- Power-up after other parameter values have been loaded (e.g. p0976 = 10).
- Upgrade firmware to later version.

4.1.2 Explanation of the list of faults and alarms

The data in the following example has been chosen at random. The information listed below is the maximum amount of information that a description can contain. Some of the information is optional.

The "List of faults and alarms" (Page 1427) has the following layout:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name		
Message value:	Component number: %1, fault cause: %2		
Message class:	Text of the message class (number according to PROFIdrive)		
Drive object:	List of objects.		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledgement:	NONE		
Cause:	Description of possible causes. Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional).		
Remedy:	Description of possible remedies.		
Response to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)		
Acknowl. upon F:	IMMEDIATELY (POWER ON)		
Response upon N:	NONE		
Acknowl. upon N:	NONE		

----- **End of example** -----

Axxxxx	Alarm xxxxx
Axxxxx (F, N)	Alarm xxxxx (message type can be changed to F or N)
Fxxxxx	Fault xxxxx
Fxxxxx (A, N)	Fault xxxxx (report type can be changed to A or N)
Nxxxxx	No message
Nxxxxx (A)	No message (message type can be changed to A)
Cxxxxx	Safety message (separate message buffer)

A message comprises a letter followed by the relevant number.

The meaning of the letters is as follows:

- A means "Alarm"
- F means "Fault"
- N means "No message" or "Internal message"
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information about reaction and acknowledgment is specified independently for a message with adjustable message type (e.g. reaction to F, acknowledgment to F).

Note

You can change the default properties of a fault or alarm by setting parameters.

The "List of faults and alarms" (Page 1427) supplies information referred to the properties of a message set as default. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value informs you about the composition of the fault/alarm value.

Example:

Message value: Component number: %1, fault cause: %2

This message value contains information about the component number and cause of the fault. The entries %1 and %2 are placeholders, which are filled appropriately in online operation (e.g. with the commissioning software).

Message class:

For each message, specifies the associated message class with the following structure:

Text of the message class (number according to PROFIdrive)

The message classes are transferred at different interfaces to higher-level control systems and their associated display and operating units.

The message classes that are available are shown in Table "Message classes and coding of various diagnostic interfaces (Page 1421)". In addition to the text of the message class and their number according to PROFIdrive – as well as a brief help text regarding the cause and remedy – they also include information about the various diagnostic interfaces:

- PN (hex)

Specifies the "Channel error type" of the PROFINET channel diagnostics.

When activating the channel diagnostics, using the GSDML file, the texts listed in the table can be displayed.
- DS1 (dec)

Specifies the bit number in data set DS1 of the diagnostic alarm for SIMATIC S7.

When the diagnostic alarms are activated, the texts listed in the table can be displayed.
- DP (dec)

Specifies the "Error type" of the channel-related diagnostics for PROFIBUS.

When the channel diagnostics are activated, the texts listed in the standard and the GSD file can be displayed.

- ET 200 (dec)
Specifies the "Error type" of the channel-related diagnostics for the SIMATIC ET 200pro FC-2 device.
When the channel diagnostics are activated, the texts listed in the standard and the GSD file of the ET 200pro can be displayed.
- NAMUR (r3113.x)
Specifies the bit number in parameter r3113.
For the interfaces DP, ET 200, NAMUR, in some instances, the message classes are combined.

Safety monitoring channel has detected an error (10) A safe operation monitoring function has detected an error.	9009	9	24	25	8
Actual position/speed value incorrect or not available (11) An illegal signal state was detected while evaluating the encoder signals (track signals, zero marks, absolute values ...). Check the encoder / state of the encoder signals. Observe the maximum permissible frequencies.	900A	10	25	29	9
Internal (DRIVE-CLiQ) communication faulted (12) The internal communication between the SINAMICS components is faulted or interrupted. Check the DRIVE-CLiQ wiring. Ensure an EMC-compliant installation. Observe the maximum permissible quantity structures / cycles.	900B	11	26	31	10
Infeed fault (13) The infeed is faulty or has failed. Check the infeed and its environment (line supply, filters, reactors, fuses ...). Check the infeed control.	900C	12	27	24	11
Braking controller / Braking Module faulted (14) The internal or external Braking Module is faulted or overloaded (temperature). Check the connection/state of the Braking Module. Comply with the permissible number of braking operations and their duration.	900D	13	28	24	15
Line filter fault (15) The line filter monitoring has detected an excessively high temperature or another impermissible state. Check the temperature / temperature monitoring. Check the configuration to ensure that it is permissible (filter type, infeed, thresholds).	900E	14	17	24	15
External measured value / signal state outside of the permissible range (16) A measured value / signal state read in via the input area (digital/analog/temperature) has assumed an impermissible value/state. Identify and check the relevant signal. Check the set thresholds.	900F	15	29	26	15
Application / technological function faulty (17) The application / technological function has exceeded a (set) limit (position, velocity, torque ...). Identify and check the relevant limit. Check the setpoint specification of the higher-level controller.	9010	16	30	9	15

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Component:

Type of hardware component that has triggered the fault or alarm.

With "Component: None" it is not possible to assign the message to a hardware component.

Propagation:

In the case of faults that are, for example, triggered by the Control Unit or a Terminal Module, central functions of the drive are also often affected. Using propagation, faults that are triggered by one drive object are therefore passed on to other drive objects.

There are the following types of propagation:

- BICO
The fault is passed on to all active drive objects with closed-loop control functions (infeed, drive) to which there is a BICO interconnection.
- DRIVE
The fault is passed on to all active drive objects with closed-loop control functions.

- GLOBAL

The fault is passed on to all active drive objects.

- LOCAL

The response of this type of propagation is dependent on parameter p3116.

With binector input p3116 = 0 (factory setting) the following applies:

The fault is passed on to the first active drive object with closed-loop control functions.

With binector input p3116 = 1-signal, the following applies:

The fault is not passed on.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional parentheses indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note

See Table "Fault reactions" (Page 1415).

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional parentheses indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note

See Table "Acknowledging faults" (Page 1417).

Cause:

Describes the possible causes of the fault or alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered into the fault buffer in r0949[0...63] and specifies additional, more precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, more precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0...7] and specifies additional, more precise information about an alarm.

Remedy:

Description of the methods available for eliminating the cause of the active fault/alarm.

 WARNING
In certain cases, servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

4.1.3 Number ranges of faults and alarms**Note**

The following number ranges represent an overview of all faults and alarms used in the SINAMICS drive family.

The faults and alarms for the product described in this List Manual are described in detail in "List of faults and alarms" (Page 1427).

Faults and alarms are organized into the following number ranges:

Table 4-5 Number ranges of faults and alarms

Acknowledge:	NONE		
Cause:	The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit. Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component.		
Remedy:	Update the firmware using the commissioning tool: The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out. Firmware update via parameter: - take the component number from the alarm value and enter into p7828. - start the firmware download with p7829 = 1.

A01007	POWER ON for DRIVE-CLiQ component required		
Message value:	Component number: %1		
Message class:	General drive fault (19)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	A DRIVE-CLiQ component must be switched on again (POWER ON) (e.g. due to a firmware update). Alarm value (r2124, interpret decimal): Component number of the DRIVE-CLiQ component. Note: For a component number = 1, a POWER ON of the Control Unit is required.		
Remedy:	- Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again. - For SINUMERIK, auto commissioning is prevented. In this case, a POWER ON is required for all components and the auto commissioning must be restarted.		

A01009 (N)	CU: Control module overtemperature		
Message value:	-		
Message class:	Overtemperature of the electronic components (6)		
Drive object:	All objects		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.		
Remedy:	- check the air intake for the Control Unit. - check the Control Unit fan. Note: The alarm is automatically withdrawn once the limit value has been fallen below.		
Reaction upon N:	NONE		
Acknowl. upon N:	NONE		

F01010	Drive type unknown

Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	An unknown drive type was found. Fault value (r0949, interpret decimal): Drive object number (refer to p0101, p0107).		
Remedy:	- replace Power Module. - carry out a POWER ON (switch-off/switch-on) for all components. - upgrade firmware to later version. - contact Technical Support.		

F01014	Topology: DRIVE-CLiQ component property changed		
Message value:	Component number: %1		
Message class:	Hardware/software error (1)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	The properties of the DRIVE-CLiQ component have fundamentally changed. Fault value (r0949, interpret hexadecimal): Component number.		
Remedy:	- check the DRIVE-CLiQ component, and if required replace. - carry out a warm restart (p0009 = 30, p0976 = 2, 3).

F01030 Sign-of-life failure for master control

Message value: -
Message class: Communication error to the higher-level control system (9)
Drive object: B_INF, VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: Vector: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Infeed: OFF1 (NONE, OFF2)
Acknowledge: IMMEDIATELY
Cause: For active PC master control, no sign-of-life was received within the monitoring time.
The master control was returned to the active BICO interconnection.
Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
The monitoring time is set as follows using the commissioning tool:
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01031 Sign-of-life failure for OFF in REMOTE

Message value: -
Message class: Communication error to the higher-level control system (9)
Drive object: B_INF, VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: Vector: OFF3 (IASC/DCBRK, NONE, OFF1, OFF2, STOP2)
Infeed: OFF1 (NONE, OFF2)
Acknowledge: IMMEDIATELY
Cause: With the "OFF in REMOTE" mode active, no sign-of-life was received within 3 seconds.
Remedy:

- check the data cable connection at the serial interface for the Control Unit (CU) and operator panel.
- check the data cable between the Control Unit and operator panel.

A01032 (F) ACX: all parameters must be saved

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE

Component:	None
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The change of a reference parameter meant that for an involved parameter the selected value was not able to be re-calculated in the per unit representation. The change was rejected and the original parameter value restored. Fault value (r0949, parameter): Parameter whose value was not able to be re-calculated. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
Remedy:	- Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation. - technology unit selection (p0595) before changing the reference parameter p0596, set p0595 = 1.

Cause: When downloading the device parameterization, a parameter back-up file PSxxxxxyy.ACX associated with a drive object cannot be found.

Fault value (r0949, interpret hexadecimal):

Byte 1: yyy in the file name PSxxxxxyy.ACX

yyy = 000 --> consistency back-up file

yyy = 001 ... 062 --> drive object number

yyy = 099 --> PROFIBUS parameter back-up file

Byte 2, 3, 4:

Only for internal Siemens troubleshooting.

Remedy: If you have saved your project data using the commissioning tool, carry-out a new download for your project.

Save using the function "Copy RAM to ROM" or with p0977 = 1.

This means that the parameter files are again completely written into the non-volatile memory.

Component: None

Propagation: GLOBAL

Reaction: OFF2

Acknowledge: POWER ON

Cause: A parameter was changed, which means that it is necessary to save the parameters and reboot.

Remedy:

- save parameters (p0971, p0977).

- carry out a POWER ON (switch-off/switch-on) for all components.

Then:

- upload the drive unit (commissioning tool).

Cause: A parameter was changed, which means that it is necessary to save the parameters and reboot.

Examples:

- p1810.2 (wobulation of the pulse frequency) and p1802 (edge modulation)
- p1750.5 (cl.-loop control mode RESM and PMSM up to f=0Hz with HF signal injection)

Remedy:

- save parameters (p0971, p0977).
- carry out a POWER ON for all components (switch on the Control Unit with or after the power units).

Then:

- upload the drive unit (commissioning tool).

Note:

When changing p1750.5 or p1810.2 for edge modulation, a warm restart is sufficient (p0009 = 30, p0976 = 3).

Acknowledge: IMMEDIATELY

Cause: A fatal error was detected when downloading a project using the commissioning tool.

Fault value (r0949, interpret decimal):

1: Device status cannot be changed to Device Download (drive object ON?).

2: Incorrect drive object number.

3: A drive object that has already been deleted is deleted again.

4: Deleting of a drive object that has already been registered for generation.

5: Deleting a drive object that does not exist.

6: Generating an undeleted drive object that already existed.

7: Regenerating a drive object already registered for generation.

8: Maximum number of drive objects that can be generated exceeded.

9: Error while generating a device drive object.

10: Error while generating target topology parameters (p9902 and p9903).

11: Error while generating a drive object (global component).

12: Error while generating a drive object (drive component).

15: Drive status cannot be changed to drive download.

16: Device status cannot be changed to "ready for operation".

17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.

18: A new download is only possible if the factory settings are restored for the drive unit.

19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)

20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR).

21: Error when accepting the download parameters.

22: Software-internal download error.

23: download not possible when know-how protection is activated.

24: download not possible during a partial power up after inserting a component.

25: The configuration is inconsistent. Know-how protection is either not activated or only partially.

Additional values:

Only for internal Siemens troubleshooting.

- Remedy:**
- use the current version of the commissioning tool.
 - modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
 - change the drive state (is a drive rotating or is there a message/signal?).
 - carefully note any other active messages/signals and remove their cause (e.g. correct any incorrectly set parameters).
 - automatically calculate the control parameters (p0340). Then set p0010 = 0.
 - boot from previously saved files (switch-off/switch-on or p0976).
 - before a new download, restore the factory setting if the know-how protection was not activated on all drive objects.

Drive object:	All objects
Component:	Control Unit (CU)
Propagation:	GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	At least one system overload has been identified. Fault value (r0949, interpret decimal): 1: Computing time load too high (r9976[1]). 5: Peak load too high (r9976[5]). Note: As long as this fault is present, it is not possible to save the parameters (p0971, p0977). See also: r9976 (System utilization)
Remedy:	For fault value = 1, 5: - reduce the computing time load of the drive unit (r9976[1] and r9976[5]) to under 100 %. - check the sampling times and adjust if necessary (p0115, p0799, p4099). - deactivate function modules. - deactivate drive objects. - remove drive objects from the target topology. - note the DRIVE-CLiQ topology rules and if required, change the DRIVE-CLiQ topology. When using the Drive Control Chart (DCC) or free function blocks (FBLOCKS), the following applies: - the computing time load of the individual run-time groups on a drive object can be read out in r21005 (DCC) or r20005 (FBLOCKS). - if necessary, the assignment of the run-time group (p21000, p20000) can be changed in order to increase the sampling time (r21001, r20001). - if necessary, reduce the number of cyclically calculated blocks (DCC) and/or function blocks (FBLOCKS).

The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation).
The parameters of the sampling times can also be changed with automatic calculations.
Example for highest common denominator: 125 s, 125 μ s, 62.5 μ s --> 62.5 μ s
- Remedy:**
- check the DRIVE-CLiQ cables.
- set a valid sampling time.

A01224 CU: Pulse frequency inconsistent

- Message value:** %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: When changing the minimum pulse frequency (p0113) inconsistency between the pulse frequencies was identified.
Alarm value (r2124, interpret decimal):
1: Value lower than minimum value.
2: Value higher than maximum value.
3: Resulting sampling time is not a multiple of 1.25 μ s.
4: Value does not match isochronous PROFIBUS operation.
10: Special restriction of the drive object violated.
99: Inconsistency of cross drive objects detected.
116: Recommended clock cycle in r0116[0...1].
- Remedy:**
Set a valid pulse frequency.

F01250 CU: CU-EEPROM incorrect read-only data

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** LOCAL
Reaction: NONE (OFF2)
Acknowledge: POWER ON
Cause: Error when reading the read-only data of the EEPROM in the Control Unit.
 Fault value (r0949, interpret decimal):
 Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (switch-off/switch-on).
 - replace the Control Unit.

A01251 CU: CU-EEPROM incorrect read-write data

Message value: %1
Message class: Hardware/software error (1)
Drive object: All objects
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE

Cause: Error when reading the read-write data of the EEPROM in the Control Unit.
 Alarm value (r2124, interpret decimal):
 Only for internal Siemens troubleshooting.
Remedy: For alarm value r2124 < 256, the following applies:
 - carry out a POWER ON (switch-off/switch-on).
 - replace the Control Unit.
 For alarm value r2124 >= 256, the following applies:
 - for the drive object with this alarm, clear the fault memory (p0952 = 0).
 - as an alternative, clear the fault memory of all drive objects (p2147 = 1).
 - replace the Control Unit.

A01302

Error in the component trace

Message value: %1

Message class: General drive fault (19)

Drive object: B_INF, VECTOR_G

Component: None

Propagation: LOCAL

Reaction: NONE

Acknowledge: NONE

Cause:

An error has occurred in the component trace.

The message appears in the following cases:

- upload trace data (p7792 = 1).

- change factory setting (p7790, p7791) for missing property "component trace" (r0193.1 = 0).

Alarm value (r2124, interpret decimal):

1: The DRIVE-CLiQ component does not support the component trace (r0193.1 = 0).

101: Data from trace 1 cannot be read.

102: Data from trace 2 cannot be read.

103: Data from trace 3 cannot be read.

104: Data from trace 4 cannot be read.

105: Data from trace 5 cannot be read.

Remedy:

For alarm value = 1:

Upgrade the firmware of the DRIVE-CLiQ component involved.

F01303

Component does not support the required function

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None

Propagation: BICO

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause:

A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.

Fault value (r0949, interpret decimal):

1: The component does not support the deactivation.

101: The Motor Module does not support an internal armature short-circuit.

102: The Motor Module does not support the deactivation.

201: The Sensor Module does not support actual value inversion (p0410.0 = 1) when using a Hall sensor (p0404.6 = 1) for the commutation.

202: The Sensor Module does not support parking/unparking.

203: The Sensor Module does not support the deactivation.

204: The firmware of this Terminal Module 15 (TM15) does not support the application TM15DI/DO.

205: The Sensor Module does not support the selected temperature evaluation (r0458, r0459).

206: The firmware of this Terminal Modules TM41/TM31/TM15 refers to an old firmware version. It is urgently necessary to upgrade the firmware to ensure disturbance-free operation.

207: The power unit with this hardware version does not support operation with device supply voltages of less than 380 V.

208: The Sensor Module does not support deselection of commutation with zero mark (via p0430.23).

211: The Sensor Module does not support single-track encoders (r0459.10).

212: The Sensor Module does not support LVDT sensors (p4677.0).

213: The Sensor Module does not support the characteristic type (p4662).

214: The power unit does not support the temperature evaluation via PT1000 (r0193).

215: The Terminal Module does not support the temperature evaluation via PT1000

216: The Voltage Sensing Module (VSM) does not support operation with a PT1000 temperature sensor.

Remedy:

Upgrade the firmware of the DRIVE-CLiQ component involved.

For fault value = 205, 214, 215:

- check parameter p0600 and p0601 and if required, adapt.

- For fault value = 207:
- replace the power unit or if required set the device supply voltage higher (p0210).
For fault value = 208:
- check parameter p0430.23 and reset if necessary.
For fault value = 216:
- check the setting of the sensor type (p3665).
- use a Voltage Sensing module that supports operation with PT1000 (MLFB ...-xxx1).

Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY		
Cause:	The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning tool. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)		
Remedy:	One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning is still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). In general: Set p0099 = r0098, set p0009 = 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0.		

Generating vector drives with parallel connection: set p0097 to 12, set p0009 to 0.

In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107).

If commissioning has already been completed:

- re-establish the original connections and re-connect power to the Control Unit.
- restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again.
- change the device parameterization to match the connections (this is only possible using the commissioning tool).

Notice:

Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning tool and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting.

Topology: Two Control Units identified on the DRIVE-CLiQ line

Message value: component number: %1, connection number: %2

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: All objects

Component: None **Propagation:** LOCAL

Reaction: NONE (OFF2)

Acknowledge: IMMEDIATELY

Cause: In the actual topology, 2 Control Units are connected with one another through DRIVE-CLiQ.

As standard, this is not permitted.

This is only permitted if the Technology Extension OALINK has already been installed on the two Control Units and has been commissioned online.

Fault value (r0949, interpret hexadecimal):

yyxx hex:

yy = connection number of the Control Unit at which the second Control Unit is connected

xx = component number of the Control Unit at which the second Control Unit is connected

Note:

Pulse enable is withdrawn and prevented.

Remedy: In general:

- remove the connection to the second Control Unit and restart.
- for the S120M component DRIVE-CLiQ extension, interchange the hybrid cable (IN/OUT).

When using OALINK:

- remove the DRIVE-CLiQ connection and restart the systems.
- install OALINK on both Control Units and activate.
- Check the configuration of the DRIVE-CLiQ sockets in OALINK.

A01358	Topology: Line termination not available

Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	At least one line with distributed drives is not terminated. The last participant on the line must be terminated with a line termination connector. This therefore ensures the degree of protection of the distributed drives. Alarm value (r2124, interpret hexadecimal): zzyyxx hex: zz = connection number of the distributed drive where there is no terminating connector yy = component number xx = CU connection number		
Remedy:	Install the line terminating connector for the last distributed drive.

Component class and connection number are described in F01375.		
Remedy:	Adapting topologies: - insert the components involved at the right connection (correct the actual topology). - adapt the project/parameterizing in the commissioning tool (correct the target topology). Check the hardware: - check the 24 V supply voltage. - check DRIVE-CLiQ cables for interruption and contact problems. - check that the component is working properly. Note: Under "Topology --> Topology view" the commissioning tool where relevant offers improved diagnostics capability (e.g. setpoint/actual value comparison).

A01507 (F, N)	BICO: Interconnections to inactive objects present		
Message value:	%1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	BICO
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	There are BICO interconnections to an inactive/inoperable drive object. The BI/CI parameters involved are listed in r9498. The associated BO/CO parameters are listed in r9499. The list of the BICO interconnections to other drive objects is displayed in r9491 and r9492 of the deactivated drive object. Note: r9498 and r9499 are only written to, if p9495 is not set to 0. Alarm value (r2124, interpret decimal): Number of BICO interconnections found to inactive drive objects.		
Remedy:	- set all open BICO interconnections centrally to the factory setting with p9495 = 2. - make the non-operational drive object active/operational again (re-insert or activate components).

Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	None
Reaction:	NONE

Cause:	The maximum number of BICO interconnections (signal sinks) when deactivating a drive object was exceeded. When deactivating a drive object, all BICO interconnections (signal sinks) are listed in the following parameters: - r9498[0...29]: List of the BI/CI parameters involved. - r9499[0...29]: List of the associated BO/CO parameters.
Remedy:	Not necessary. This alarm is automatically withdrawn as soon as no BICO interconnection is entered in r9498[29] and r9499[29] (value = 0). Notice: When re-activating the drive object, all BICO interconnections should be checked and if required, re-established.

Cause:	The requested BICO interconnection was established. However, a conversion is made between the BICO output and BICO input using the reference values. An interconnection is made between different drive objects and the BICO output has different normalized units than the BICO input or the normalized units are the same but the reference values are different. Example 1: BICO output with voltage normalized unit, BICO input with current normalized unit, BICO output and BICO input lie in different drive objects. Message class: Safety monitoring channel has identified an error (10)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The drive-integrated "Safety Integrated" function on the Control Unit (CU) has detected a fault and initiated a STOP A (STO via the safety switch-off signal path of the Control Unit).
 - forced checking procedure (test stop) of the safety switch-off signal path of the Control Unit unsuccessful.
 - subsequent response to fault F01611 (defect in a monitoring channel).
 Fault value (r0949, interpret decimal):
 0: Stop request from monitoring channel 2.
 1005:
 - STO active, although STO not selected and there is no internal STOP A active.
 - For a Power Module with "STO via terminals at the Power Module" (STO_A/STO_B), these terminals are active (DIP switch to "ON"). However, the "STO via terminals at the Power Module" function has not been enabled (p9601.7 = p9801.7 = 0).
 1010: STO inactive although STO is selected or an internal STOP A is present.

Error in the PROFIsafe control.
For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.
- 6000: A fatal PROFIsafe communication error has occurred.
- 6064 ... 6071: error when evaluating the F parameter. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.
- 6064: Destination address and PROFIsafe address are different (F_Dest_Add).

- 6066: Source address not valid (F_Source_Add).
- 6067: Watchdog time not valid (F_WD_Time).
- 6068: Incorrect SIL level (F_SIL).
- 6069: Incorrect F-CRC length (F_CRC_Length).
- 6070: Incorrect F parameter version (F_Par_Version).
- 6071: CRC error for the F parameters (CRC1). The transferred CRC value of the F parameters does not match the value calculated in the PROFIsafe driver.
- 6072: F parameterization is inconsistent.
- 6165: A communications error was identified when receiving the PROFIsafe telegram. The fault may also occur if an inconsistent or out-of-date PROFIsafe telegram has been received after switching the Control Unit off and on or after plugging in the PROFIBUS/PROFINET cable.
- 6166: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.
- Remedy:**
- For fault value = 1 ... 5 and 7 ... 999:
- check the cross data comparison that resulted in a STOP F.
 - carry out a POWER ON (switch-off/switch-on) for all components.
 - upgrade the Motor Module software.
 - upgrade the Control Unit software.
- For fault value = 6:
- carry out a POWER ON (switch-off/switch-on) for all components.
 - upgrade the Motor Module software.
 - upgrade the Control Unit software.
- For fault value = 1000:
- check the EP terminal at the Motor Module (contact problems).
 - PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
 - check the wiring of the failsafe inputs at the TM54F (contact problems).
 - check the discrepancy time, and if required, increase the value (p9650/p9850).
- For fault value = 1001, 1002:
- carry out a POWER ON (switch-off/switch-on) for all components.
 - upgrade the Motor Module software.
 - upgrade the Control Unit software.
- For fault value = 1900, 1901, 1902:
- carry out a POWER ON (switch-off/switch-on) for all components.
 - upgrade the Control Unit software.
 - replace Control Unit.
- For fault value = 2000, 2001, 2002, 2003, 2004, 2005:
- check the discrepancy time, and if required, increase the value (p9650/p9850, p9652/p9852).
 - check the wiring of the safety-relevant inputs (SGE) (contact problems).

- check the causes of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.
- diagnose the other active faults and resolve the causes.

Note:

This fault can be acknowledged after removing the cause of the error and after correct selection/deselection of STO.

For fault value = 6000:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- increase the monitoring cycle clock settings (p9500, p9511).
- upgrade firmware to later version.
- contact Technical Support.
- replace the Control Unit.

For fault value = 6064:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave.
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).

For fault value = 6065:

- check the setting of the value in the F parameter F_Dest_Add at the PROFIsafe slave. It is not permissible for the destination address to be either 0 or FFFF!

For fault value = 6066:

- check the setting of the value in the F parameter F_Source_Add at the PROFIsafe slave. It is not permissible for the source address to be either 0 or FFFF!

For fault value = 6067:

- check the setting of the value in the F parameter F_WD_Time at the PROFIsafe slave. It is not permissible for the watch time to be 0!

For fault value = 6068:

- check the setting of the value in the F parameter F_SIL at the PROFIsafe slave. The SIL level must correspond to SIL2!

For fault value = 6069:

- check the setting of the value in the F parameter F_CRC_Length at the PROFIsafe slave. The setting of the CRC2 length is 2-byte CRC in the V1 mode and 3-byte CRC in the V2 mode!

For fault value = 6070:

- check the setting of the value in the F parameter F_Par_Version at the PROFIsafe slave. The value for the F parameter version is 0 in the V1 mode and 1 in the V2 mode!

For fault value = 6071:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and, if required, update.

For fault value = 6072:

- check the settings of the values for the F parameters and, if required, correct.

The following combinations are permissible for F parameters F_CRC_Length and F_Par_Version:

F_CRC_Length = 2-byte CRC and F_Par_Version = 0

F_CRC_Length = 3-byte CRC and F_Par_Version = 1

For fault value = 6165:

- if the fault occurs after powering up the Control Unit or after plugging in the PROFIBUS/PROFINET cable, acknowledge the fault.
- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the two monitoring channels and, if required, carry out a diagnostics routine for the faults identified.
- check whether all F parameters of the drive match the F parameters of the F host.

For fault value = 6166:

- check the configuration and communication at the PROFIsafe slave.
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.
- check whether all F parameters of the drive match the F parameters of the F host.

4 Faults and alarms

4.2 List of faults and alarms

For fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.
- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.
- increase the DP clock cycle for operation with an isochronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.
- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

For fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500/p9300).

For fault value = 107:

- set an actual value sensing clock cycle that matches the current controller clock cycle (p9511 $\geq 4 * p0115[0]$, $8 * p0115[0]$) is recommended.

Note:

An actual value sensing clock cycle (p9511) that is set too low, can sporadically mean that safety messages C01711/C30711 are output with message value 1020 or 1021.

For fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.
- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured. This must be set to less than 8 ms. If this is not possible, then p9511 must be set to the required actual value sensing clock cycle (< 8 ms).
- For SIMOTION D410-2, a suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized. Otherwise, the clock cycle must be set to less than 8 ms.

For fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p0115[0]).
- SINAMICS S110: set the actual value sensing clock cycle to p9511 = 250 µs.

For fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

For fault value = 111:

- set the monitoring clock cycle in p9500 as an integer multiple of the sampling time of the current controller (p0115[0]).

For fault value = 112:

- set the actual value sensing clock cycle p9511 to the required value (not equal to zero).

For fault value = 200, 201:

- increase the current controller sampling time (p0115[0]).
- if required, reduce the number of components connected to the corresponding DRIVE-CLiQ line, or distribute the components across several DRIVE-CLiQ sockets.

For fault value = 202:

- set the current controller sampling time to a sensible value (p0115[0]).

Cause:

There is a PROFIBUS/PROFINET configuration error for using Safety Integrated monitoring functions with a higher-level control (SINUMERIK or F-PLC).

Note:

For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

200: A safety slot for receive data from the control has not been configured.

210, 220: The configured safety slot for the receive data from the control has an unknown format.

230: The configured safety slot for the receive data from the F-PLC has the incorrect length.

231: The configured safety slot for the receive data from the F-PLC has the incorrect length.

240: The configured safety slot for the receive data from the SINUMERIK has the incorrect length.

250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive.

300: A safety slot for the send data to the control has not been configured.

310, 320: The configured safety slot for the send data to the control has an unknown format.

330: The configured safety slot for the send data to the F-PLC has the incorrect length.

331: The configured safety slot for the send data to the F-PLC has the incorrect length.

340: The configured safety slot for the send data to the SINUMERIK has the incorrect length.

400: The telegram number in the F-PLC does not match the parameterization in the drive.

Remedy:

The following generally applies:

- check and, if necessary, correct the PROFIBUS/PROFINET configuration of the safety slot on the master side.

- upgrade the Control Unit software.

For fault value = 250:

- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.

For fault value = 231, 331:

- in the drive, parameterize the appropriate PROFIsafe telegram (p9611/p9811) to be set on the F-PLC and to be set in p60022.

- Configure the PROFIsafe telegram matching the parameterization (p9611/p9811) in the F-PLC.

SI P1 (CU): Write request for parameter rejected

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: TM54F_MA, TM54F_SL

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The write request for one or several Safety Integrated parameters on the Control Unit (CU) was rejected.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

1: The Safety Integrated password is not set.

2: A reset of the drive parameters was selected. However, the Safety Integrated parameters were not reset, as Safety Integrated is presently enabled.

27: An attempt was made to activate the Basic Functions by controlling via TM54F although this cannot be supported.

See also: p0970, p3900, p9612, r9771, r9871

Remedy:

For fault value = 1:

- set the Safety Integrated password (p10061).

For fault value = 2:

- inhibit Safety Integrated (p9501, p9601) or reset safety parameters (p0970 = 5), then reset the drive parameters again.

For fault value = 27:

- check whether there are faults in the safety function alignment between the Control Unit and the Motor Module involved (F01655, F30655) and if required, carry out diagnostics for the faults involved.
- use Motor Modules that supports the required function.

Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The simulation of the digital inputs of the Control Unit (p0795) is active. It is not permissible that safety inputs are simulated. Fault value (r0949, interpret binary): The displayed bits indicate which digital inputs must not be simulated.
Remedy:	- deactivate the simulation of the digital inputs of the Control Unit for the safety inputs (p0795). - acknowledge fault.

F01663	SI P1 (CU): Copying the SI parameters rejected
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR_G
Component:	None
Propagation:	DRIVE
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	In p9700, the value 87 or 208 is saved or was entered offline. This is the reason that when booting, an attempt is made to copy Safety Integrated parameters from monitoring channel 1 to monitoring channel 2. However, no safety-relevant function has been selected in monitoring channel 1 (p9501 = 0, p9601 = 0). Copying was rejected for safety reasons. As a consequence, inconsistent parameterization can occur in both monitoring channels, which in turn results in additional error messages. Especially for inconsistent enabling of the safety functions on both monitoring channels (p9601 = 0, p9801 <> 0), fault F30625 is output.

Note:

This fault does not result in a safety stop response.

SI: Safety Integrated

See also: p9700 (SI Motion copy function)

Remedy:

- set p9700 to 0.
 - check p9501 and p9601 and if required, correct.
 - restart the copying function by entering the corresponding value into p9700.
- Alternatively, using the STARTER commissioning tool, perform the following steps in the online mode:
- call the "Safety Integrated" screen form (the field "Select safety functions" is at "No Safety Integrated").
 - click on "Change settings".
 - click on "Activate settings" (as a consequence, Safety Integrated is inhibited on both monitoring channels).
 - save all parameters (p0977 = 1 or "copy RAM to ROM").
 - carry out a POWER ON (switch-off/switch-on) for all components.

Cause: During booting, the system detected that the "Firmware update automatic" function (p7826 = 1) was not activated. This function must be activated for automatic firmware updates/downgrades to prevent impermissible version combinations when safety functions are enabled.

Note:

This fault does not result in a safety stop response.

See also: p7826 (Firmware update automatic)

Remedy:

- When safety functions are enabled (p9501 <> 0 and/or p9601 <> 0):
1. Activate the "Firmware update automatic" function (p7826 = 1).
 2. Backup the parameters (p0977 = 1) and carry out a POWER ON.
- When deactivating the safety functions (p9501 = 0, p9601 = 0), the fault can be acknowledged after exiting the safety commissioning mode.

Propagation:	GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The parameterization of a Sensor Module used for Safety Integrated is not permissible. Note: This fault results in a STOP A that cannot be acknowledged.

Fault value (r0949, interpret decimal):

- 1: No encoder was parameterized for Safety Integrated.
- 2: An encoder was parameterized for Safety Integrated that does not have an A/B track (sine/cosine).
- 3: The encoder data set selected for Safety Integrated is still not valid.
- 4: A communication error with the encoder has occurred.
- 5: Number of relevant bits in the encoder coarse position invalid.
- 6: DRIVE-CLiQ encoder configuration invalid.
- 7: Non-safety relevant component of the encoder coarse position for the linear DRIVE-CLiQ encoder not valid.
- 8: Parameterized Safety comparison algorithm not supported.
- 9: Relationship between the grid division and measuring step for linear DRIVE-CLiQ encoder is not binary.
- 10: For an encoder used for Safety Integrated, not all of the Drive Data Sets (DDS) are assigned to the same Encoder Data Set (EDS) (p0187 ... p0189).
- 11: The zero point setting of a linear DRIVE-CLiQ encoder used in Safety Integrated is not zero.
- 12: The second encoder is not parameterized (p9526 = 1 is not permissible).
- 13: Hydraulic Module: A second encoder has not been parameterized and a DRIVE-CLiQ encoder is not being used.
- 14: SCSE encoder is used in conjunction with an HTL/TTL encoder, another SCSE encoder or in a 1-encoder system.

Remedy:

For fault value = 1, 2:

- use and parameterize an encoder that Safety Integrated supports (encoder with track A/B sine-wave, p0404.4 = 1).

For fault value = 3:

- check whether the drive or drive commissioning function is active and if required, exit this (p0009 = p00010 = 0), save the parameters (p0971 = 1) and carry out a POWER ON

For fault value = 4:

- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Sensor Module involved and if required, carry out a diagnostics routine for the faults identified.

For fault value = 5:

- p9525 = 0 (not permissible). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 6:

- check p9515.0 (for DRIVE-CLiQ encoders, the following applies: p9515.0 = 1). Check the encoder parameterization on the Sensor Modules involved.

For fault value = 7:

- p12033 for an encoder used for Safety Integrated is not equal to 1. Use a linear DRIVE-CLiQ encoder and parameterize for p12033 = 1.

For fault value = 8:

- check p9541. Use and parameterize an encoder that implements an algorithm supported by Safety Integrated.

For fault value = 9:

- check p9514 and p9522. Use an encoder and parameterize, where the ratio between p9514 and p9522 is binary.

For fault value = 10:

- align the EDS assignment of all of the encoders used for Safety Integrated (p0187 ... p0189).

For fault value = 11:

- use and parameterize a linear DRIVE-CLiQ encoder, where the zero point setting is equal to 0.

For fault value = 12:

Align parameters p9311 and p9511, back up the parameters (p0971 = 1) and carry out a POWER ON.

If xxxx = 9517:
Parameter p9516.0 should also be checked.

For xxxx = 9319:
For the SCSE encoder, parameter p9319 must not be set higher than 11.

If xxxx = 9522:
Correct the corresponding parameter.

If xxxx = 9534 or 9535:
Reduce the limit values (absolute values) of SLP.

If xxxx = 9544:
Correct parameter (for linear axes, the maximum value is limited to 1 mm).

If xxxx = 9547:
With hysteresis/filtering enabled (p9501.16 = 1), the following applies:
- set parameters p9546 and p9547 according to the following rule: $p9547 \leq 0.75 \times p9546$
- if the actual value synchronization is enabled (p9501.3 = 1), then this rule must be complied with: $p9547 \geq p9549$

For xxxx = 9576:
- update the firmware on the Motor Module
- deselect function with value 0.

For xxxx = 9578:
- observe the information in r9790.

If xxxx = 9585:
Correct parameter (if required, also on the second monitoring channel, p9385).

F01686 SI Motion: Illegal parameterization cam position

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: For dbSI:
 - at least one enabled "Safe cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position: the minus position value of a cam must be greater than the lower modulo limit + cam tolerance (p9540) + position tolerance (p9542); the plus position value of a cam must be less than the modulo limit - cam tolerance (p9540) - position tolerance (p9542). For a parameterized modulo position (p9505>0), the lower modulo limit = 0, the upper modulo limit = p9505.
 - the cam length of cam x = p9536[x]-p9537[x] is less than the cam tolerance + the position tolerance (= p9540 + p9542).
 This also means that cams of the minus position value must be less than the plus position value.
 For ncSI:
 At least one enabled "Safety Cam" (SCA) is parameterized in p9536 or p9537 too close to the tolerance range around the modulo position.
 The following conditions must be complied with to assign cams to a cam track:
 - the cam length of cam x = p9536[x]-p9537[x] must be greater or equal to the cam tolerance + the position tolerance (= p9540 + p9542). This also means that for cams on a cam track, the minus position value must be less than the plus position value.
 - the distance between 2 cams x and y (minus position value[y] - plus position value[x] = p9537[y] - p9536[x]) on a cam track must be greater than or equal to the cam tolerance + position tolerance (= p9540 + p9542).
 Note:
 This fault does not result in a safety stop response.
 Fault value (r0949, interpret decimal):

SI Motion: Axis re-configured

Message value: Parameter: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: None

Propagation: GLOBAL

Reaction: OFF2

Acknowledge: POWER ON

Cause:

The axis configuration was changed and internally set to the correct value (e.g. switchover, linear axis/rotary axis).
Parameter p0108.13 is internally set to the correct value.

Note:

This fault does not result in a safety stop response.

Fault value (r0949, interpret decimal):

Number of the parameter that initiated the change.

See also: p9502 (SI Motion axis type (Control Unit))

Remedy:

The following should be carried out after the changeover:

- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Once the Control Unit has been switched on, safety message F01680 or F30680 indicates that the checksums in r9398[0] and r9728[0] have changed in the drive. The following must, therefore, be carried out:

- activate safety commissioning mode again.
- complete safety commissioning of the drive.
- exit the safety commissioning mode (p0010).
- save all parameters (p0977 = 1 or "copy RAM to ROM").
- carry out a POWER ON.

Note:

For the commissioning tool, the units are only consistently displayed after a project upload.

Note:
This fault does not result in a safety stop response.
Fault value (r0949, interpret decimal):
0: There is no physical NVRAM available in the drive.
1: There is no longer any free memory space in the NVRAM.

Remedy: For fault value = 0:
- use a Control Unit NVRAM.
For fault value = 1:
- deselect functions that are not required and that take up memory space in the NVRAM.
- contact Technical Support.

A01691 (F) **SI Motion: Ti and To unsuitable for DP cycle**

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions.
Isochronous PROFIBUS:
The sum of Ti and To is too high for the selected DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To.
No isochronous PROFIBUS:
The DP clock cycle must be at least 4x the current controller clock cycle.
Notice:
If this alarm is not observed, then message C01711 or C30711 – with the value 1020 ... 1021 – can sporadically occur.

Remedy: Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time.
Alternative when SI monitoring integrated in the drive is enabled (p9601/p9801 > 0):
Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual values sensing clock cycle must be at least 4x the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.

Cause:	The time set in p9559 for the forced checking procedure (test stop) for the safe motion monitoring functions has been exceeded. A new forced checking procedure is required. After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - As the switch-off signal paths are not automatically checked during booting, an alarm is always issued once booting is complete. - the test must be performed within a defined, maximum time interval (p9559, maximum of 9000 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning. See also: p9559 (SI Motion forced checking procedure timer (Control Unit)), r9765 (SI Motion forced check procedure remaining time (Control Unit))
Remedy:	Carry out the forced checking procedure of the safety motion monitoring functions. The signal source to select the forced checking procedure is set via binector input p9705. Notice: It is not permissible to use TM54F inputs to select the forced checking procedure. Note: SI: Safety Integrated See also: p9705 (SI Motion test stop signal source)

Message value: -

Message class: Safety monitoring channel has identified an error (10)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: NONE (OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp).
As a result of this fault, after the time parameterized in p9556 has expired, or the speed threshold parameterized in p9560 has been undershot, message C01700 "STOP A initiated" is output.

Possible causes:

- stop request from the second monitoring channel.
- subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
- subsequent response to the message C01711 "SI Motion CU: Defect in a monitoring channel".
- subsequent response to the message C01707 "SI Motion CU: tolerance for safe operating stop exceeded".
- subsequent response to the message C01715 "SI Motion CU: Safely-Limited Position exceeded".

SI Motion P1 (CU): SAM/SBR limit exceeded

Message value: -

Message class: Safety monitoring channel has identified an error (10)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

Motion monitoring functions with encoder (p9506 = 0) or encoderless with set acceleration monitoring (SAM, p9506 = 3):

- after initiating STOP B (SS1) or STOP C (SS2), the speed has exceeded the selected tolerance.

Motion monitoring functions encoderless with set brake ramp monitoring (SBR p9506 = 1):

- after initiating STOP B (SS1) or SLS changeover to the lower speed level, the speed has exceeded the selected tolerance.

The drive is shut down by the message C01700 "SI Motion: STOP A initiated".

Remedy: Check the braking behavior and, if necessary, adapt the parameterization of the parameter settings of the "SAM" or the "SBR" function.

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the actual value (r9713[0/1]). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to message value 3). This can be ascertained by checking the safe actual positions.

Permissible deviation between the two monitoring channels: p9542/p9342.

- 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.
- 1001: Initialization error of watchdog timer.
- 1002:
User agreement after the timer has expired different.
The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.
- 1003:
Reference tolerance exceeded.
When the user agreement is set, the difference between the new reference point that has been determined after the system boots (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9544). In this case, the user agreement is withdrawn.
- 1004:
Plausibility error for user agreement.
1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.
2. The user agreement was set, although the axis has still not been referenced.

PROFIsafe message values.
For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.
5000, 5014, 5023, 5024, 5030 ... 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:
An internal software error has occurred (only for internal Siemens troubleshooting).
5012: Error when initializing the PROFIsafe driver.
5013: The result of the initialization is different for the two controllers.
5022: Error when evaluating the F parameters. The values of the transferred F parameters do not match the expected values in the PROFIsafe driver.
5025: The result of the F parameterization is different for the two controllers.
5026: CRC error for the F parameters. The transferred CRC value of the F parameters does not match the value calculated in the PST.
5065: A communications error was identified when receiving the PROFIsafe telegram.
5066: A time monitoring error (timeout) was identified when receiving the PROFIsafe telegram.
6000 ... 6166:
PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).
For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "Stop B after failure of the PROFIsafe communication" (p9612) is parameterized, the transfer of the Failsafe Values is delayed.
The significance of the individual message values is described in safety fault F01611.
7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).
7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).
7002: Cycle counter for transferring the safe position is different in both monitoring channels.
7003: error when providing the data for the "Synchronous safe position via PROFIsafe" function.
7004: PROFIsafe clock cycle not correctly synchronized to the DP clock cycle.

Remedy:
The following generally applies:
The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.
For message value = 0:
- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).
For message value = 3:
Commissioning phase:
- check the encoder parameters, and if required, correct (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).
In operation:
- check the mechanical design and the encoder signals.
- if closed-loop control with edge modulation is parameterized (p1802[x] = 9): parameterize edge modulation for actual value sensing without encoder (p9507.5 = p9307.5 = 1).
For message value = 4:
The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with message value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.
For message value = 11 ... 14:
- the limit values in p9534/p9334 or p9535/p9335 are not equal or have been set too high. Correct the values.
For message value = 15 ... 30 and 90 ... 229:
- the cam positions for function SCA in p9536/p9336, p9537/p9337 or the cam tolerance p9540/p9340 are not equal. Correct the values. Increase the cam tolerance p9540/p9340.
For message value = 232:
- increase the hysteresis tolerance (p9547/p9347). Possibly set the filtering higher (p9545/p9345).
For message value = 274, 275:
- increase the cam tolerance p9540/p9340 and/or the position tolerance p9542/p9342.

For message value = 278, 279:

- check as to whether the same acceleration limit has been set for both channels. A different result depends on whether SLA is enabled and not selected - or enabled and selected. In this case, another message value is possible.

For message value = 1 ... 999:

- if the message value is listed under cause: Check the cross-checked parameters to which the message value refers.

- copy the safety parameters.

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).

Note:

For SINAMICS firmware version ≥ 4.7 , the KDV list is increased when setting $p9567 > 0$. For a non-compatible version of SINUMERIK this can lead to an error for the data cross-check (is indicated with message value ≥ 237). If necessary, $p9567$ must be set = 0, or the firmware version of SINUMERIK upgraded.

For message value = 1000:

- investigate the signal associated with the safety-relevant input (contact problems).

For message value = 1001:

- carry out a POWER ON (switch-off/switch-on) for all components.

- upgrade the Motor Module software.

- upgrade the Control Unit software.

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing ($p9544$).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.

- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1007:

- check the PLC for the correct operating state (run state, basic program).

For message value = 1008:

- check whether incorrect or overlapping address ranges have been set in SINUMERIK machine data MD10393.

For message value = 1011:

- for diagnostics, refer to parameter ($r9571$).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.

- for 1-encoder systems, the following applies: check the encoder parameters for equality ($p9515/p9315$, $p9519/p9319$, $p9523/p9323$, $p9524/p9324$, $p9525/p9325$, $p9529/p9329$).

- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from $p04xx$, $p9700$ must be set to 46 and $p9701$ must be set to 172.

- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.

- the parameterized encoder does not correspond to the connected encoder - replace the encoder.

- check the electrical cabinet design and cable routing for EMC compliance

- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
 - replace the hardware.
- For message value = 1014:
- check the encoder actual values. If required, increase the position tolerance (p9542) and/or cam tolerance (p9540).
- For message value = 1020, 1021, 1024:
- check the communication link.
 - if required, increase the monitoring cycle clock settings (p9500, p9511).
 - carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
 - replace the hardware.
- For message value = 1033, 1034:
- if required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- For message value = 1035, if one of the safety encoders was replaced:
- confirm the hardware replacement (p9700 = 29, p9701 = 236 or p9702 = 29).
 - save all parameters (p0977 = 1 or p0971 = 1 or "copy RAM to ROM").
 - acknowledge fault (e.g. binector input p2103).
- For message value = 1039:
- check the conversion factors such as spindle pitch or gearbox ratios.
- For message value = 1041:
- check whether the motor has sufficient current (>r9785[0]).
 - reduce the minimum current (p9588).
 - for synchronous motors increase the absolute value of p9783.
 - check whether the function "Closed-loop controlled operation with HF signal injection" is activated (p1750.5 = 1) and if required, deactivate.
- For message value = 1042:
- increase the ramp-function generator ramp-up/down time (p1120/p1121).
 - check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
 - reduce the dynamic response of the setpoint value.
 - check the absolute current and voltage values, and set the control behavior so that this is greater than 3% of the rated converter data in operation or in the case of a fault.
 - increase the minimum current (p9588).
- For message value = 1043:
- increase the voltage tolerance (p9589). When operating a reluctance motor, the controller settings are generally set to be more dynamic. If this message is output for the factory setting of p9589, then the acceleration limit should be increased as countermeasure (p9589 = 500 ... 1000 %). From experience, this provides a rugged response.
 - increase the ramp-function generator ramp-up/down time (p1120/p1121).
 - check that the current/speed control is set correctly (torque-generating/field-generating current and actual speed value may not fluctuate).
 - reduce the dynamic response of the setpoint value.
- For message value = 5000, 5014, 5023, 5024, 5030, 5031, 5032, 5042, 5043, 5052, 5053, 5068, 5072, 5073, 5082 ... 5087, 5090, 5091, 5122 ... 5125, 5132 ... 5135, 5140:
- carry out a POWER ON (switch-off/switch-on) for all components.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - upgrade firmware to later version.
 - contact Technical Support.
 - replace the Control Unit.
- For message value = 5012:
- check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810). It is not permissible for the PROFIsafe address to be 0 or FFFF!
- For message value = 5013, 5025:
- carry out a POWER ON (switch-off/switch-on) for all components.
 - check the setting of the PROFIsafe address of the Control Unit (p9610) and that of the Motor Module (p9810).
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5022:

- check the setting of the values of the F parameters at the PROFIsafe slave (F_SIL, F_CRC_Length, F_Par_Version, F_Source_Add, F_Dest_add, F_WD_Time).

For message value = 5026:

- check the settings of the values of the F parameters and the F parameter CRC (CRC1) calculated from these at the PROFIsafe slave and update.

For message value = 5065:

- check the configuration and communication at the PROFIsafe slave (cons. No. / CRC).
- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

For message value = 5066:

- check the setting of the value for F parameter F_WD_Time on the PROFIsafe slave and increase if necessary.
- evaluate diagnostic information in the F host.
- check PROFIsafe connection.

For message value = 6000 ... 6999:

Refer to the description of the message values in safety fault F01611.

For message value = 7000:

- increase the position tolerance (p9542/p9342).
- determine the actual position of CU (r9713[0] and the second channel r9713[1], and check the difference for plausibility.
- reduce the difference of the actual position from CU (r9713[0] and the second channel r9713[1] for a 2-encoder system.

For message value = 7001:

- increase the scaling value for the safe position in the 16 bit notation (p9574/p9374).
- if required, reduce the traversing range.

For message value = 7002:

- carry out a POWER ON (switch-off/switch-on) for all components.
- check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

Message class:	Safety monitoring channel has identified an error (10)		
Drive object:	VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY (POWER ON)		
Cause:	The reference block transferred via PROFIsafe is negative. A reference block is used to generate a referred velocity limit value based on the reference quantity "Velocity limit value SLS1" (p9531[0]). The drive is stopped as a result of the configured stop response (p9563[0]). Message value (r9749, interpret decimal): requested, invalid reference block.		
Remedy:	In the PROFIsafe telegram, input data S_SLS_LIMIT_IST must be corrected. This message can be acknowledged without a POWER ON as follows (safe acknowledgment): - PROFIsafe. Note: SI: Safety Integrated SLS: Safely-Limited Speed / SG: Safely reduced speed

Cause:	The scaling of the brake torque for the brake test can be changed using parameter p2003. An acceptance test must be carried out again for the braking test. This determines whether the braking test is still carried out with the correct braking torque.		
Remedy:	- carry out a POWER ON (switch-off/switch-on) for all components. - repeat the acceptance test for the safe brake test if the brake test is used. See also: p2003 (Reference torque)

Cause: The transferred reference position is invalid.
 Message value (r9749, interpret decimal):
 1: It is not possible to directly transfer the reference position (p9573=89).
 2: It is not possible to transfer the reference position into the motion.
Remedy:
 - unpark axis/encoder.
 - acknowledge encoder fault
 - deactivate gearbox stage switchover.

C01770 SI Motion P1 (CU): Discrepancy error of the failsafe inputs/outputs

Message value: %1
Message class: Safety monitoring channel has identified an error (10)
Drive object: VECTOR_G
Component: Control Unit (CU) **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The failsafe digital inputs/digital outputs (F-DI/F-DO) show a different state longer than that parameterized in p10002/p10102 - or too many switching operations took place within a monitoring cycle p10002.
 Fault value (r0949, interpret bitwise binary):
 yyyyxxxx bin
 xxxx: Discrepancy error for failsafe digital inputs (F-DI).
 Bit 0: Discrepancy error for F-DI 0
 Bit 1: Discrepancy error for F-DI 1
 ...
 yyyy: Discrepancy error for failsafe digital outputs (F-DO).
 Bit 0: Discrepancy error for F-DO 0
 ...

Note:

If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.

Remedy:

- check the wiring of the F-DI (contact problems).
- if the wiring is correct, and for example there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them). The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again.

Note:

This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment).

Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10006, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.

When the "Extended message acknowledgment" function (p9507.0) is active, the following applies:

If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed.

Sets the discrepancy time for fast switching operations at the F-DIs:

For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down).
- the time between two fast switching pulses should be longer than the discrepancy time (if necessary, round up).
- the discrepancy time must be at least p9500 (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time p9500).

If a debounce time has been parameterized (p10017 > 0), then the shortest possible discrepancy time is directly specified using the debounce time.

- the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down).
- the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up).
- the discrepancy time must be at least p9500 The debounce time must always be set less than the discrepancy time.

Example:

If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:

$$p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms} \rightarrow \text{rounded-off, the following is obtained } p10002 \leq 36 \text{ ms}$$

Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.

Basic secondary condition to set the discrepancy time:

The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500).

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy:

Check the wiring of the failsafe digital output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.

- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

Cause:

The time set in p10003 for the forced checking procedure (test stop) for the failsafe digital outputs has been exceeded. A new forced checking procedure is required.

After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset.

Note:

- this message does not result in a safety stop response.

- the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning.

See also: p10003 (SI TM54F forced checking procedure timer)

Remedy:

Carry out the forced checking procedure for the digital outputs.

The signal source to select the forced checking procedure is set via binector input p10007.

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Cause: The safe brake test was canceled as a result of a fault.

Alarm value (r2124, interpret binary):

Bit 17 = 1: fault in the brake test sequence (cause, see bits 0 ... 10).

Bit 18 = 1: the internal brake is closed. It must be open when the external brake is tested (p10202).

Bit 19 = 1: the external brake is closed. It must be open when the internal brake is tested (p10202).

Bit 20 = 1: not all brakes are open (p10202).

Bit 21 = 1: axis position during the brake test not valid due to parking axis.

Bit 22 = 1: internal software error.

Bit 23 = 1: the permissible position range of the axis was violated with the brake closed (p10212/p10222).

Bit 24 = 1: the tested internal brake was opened while the brake test was active.

Bit 25 = 1: the tested external brake was opened while the brake test was active.

Bit 26 = 1: during the active brake test, the test torque left its tolerance bandwidth (20 %).

Cause for alarm value bit 17:

Bit 0 = 1: operation when selecting the brake test not enabled (r0899.2 = 0).

Bit 1 = 1: external fault occurred (e.g. the brake test that has already started is canceled by the user).

Bit 2 = 1: when selecting the brake test a brake is closed.

Bit 3 = 1: when determining the load torque a brake is closed.

Bit 4 = 1: A fault has occurred with stop response (e.g. OFF1, OFF2 or OFF3) - or the pulse enable was withdrawn (e.g. STO selected or operation no longer enabled).

Bit 5 = 1: when selecting the brake test the axis speed setpoint is too high.

Bit 6 = 1: the actual speed (r0063) of the axis is too high (e.g. brake does not hold during the brake test).

Bit 7 = 1: Incorrect speed controller mode (e.g. encoderless speed control or U/f operation).

Bit 8 = 1: closed-loop control not enabled or function generator active.

Bit 9 = 1: control does not switch over to the brake test (e.g. because PI speed control has not been parameterized).

Bit 10 = 1: torque limit reached (r1407.7, r1408.8).

Note:

SBT: Safe Brake Test

Remedy:

- remove the fault cause.

- carry out a safe acknowledgment.

- if required, restart the brake test.

For bit 17 = 1 with bit 6 = 1 or bit 23 = 1:

If the brake closing time of the motor holding brake (p1217) has been set too low, then at the start of the brake test, the brake is closed too late. The brake closing time should be adapted (p1217).

Drive object:	VECTOR_G		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	When parameterizing the modulo value for safe position via PROFIsafe (p9505) the position actual value can jump when the range that can be represented overflows. Range that can be represented: - 32-bit value: +/- 2048 revolutions - 16-bit value: +/- 2048 revolutions (depending on p9574)		
Remedy:	Correct the parameter assignment. Set p9505 to 2 ⁿ revolutions - and to complete revolutions (i.e. a multiple of 360 °). Note: This alarm can be hidden for the case that the possible position actual value jump can be tolerated for the particular application, or does not represent a problem; for example because the parameterized modulo range fits "almost as integer number" in the range of +/- 2048 revolutions that can be represented. To re-parameterize the alarm to "NO REPORT", it is not permissible that the alarm is present. As a consequence, the following sequence is required for the re-parameterization: - correct p9505 to "2 ⁿ ". - re-parameterize the alarm using p2118 and p2119. - set p9505 back to the required value.

Cause: Parameterization for isochronous operation is not permissible.

Alarm value (r2124, interpret decimal):

0: Bus cycle time $T_{dp} < 0.5$ ms.

1: Bus cycle time $T_{dp} > 32$ ms.

2: Bus cycle time T_{dp} is not an integer multiple of the current controller sampling time.

3: Instant of the actual value sensing $T_i > \text{Bus cycle time } T_{dp}$ or $T_i = 0$.

4: Instant of the actual value sensing T_i is not an integer multiple of the current controller sampling time.

5: Instant of the setpoint acceptance $T_o \geq \text{Bus cycle time } T_{dp}$ or $T_o = 0$.

6: Instant of the setpoint acceptance T_o is not an integer multiple of the current controller sampling time.

7: Master application cycle time T_{mapc} is not an integer multiple of the speed controller sampling time.

8: Bus reserve bus cycle time T_{dp} - data exchange time T_{dx} less than two current controller sampling times.

10: Instant of the setpoint acceptance $T_o \leq \text{data exchange time } T_{dx} + \text{current controller sampling time}$

11: Master application cycle time $T_{mapc} > 14 \times T_{dp}$ or $T_{mapc} = 0$.

Cause:	The value for the offset is higher than the value for the upper limit or lower than the value for the lower limit. See also: p4826 (Function generator offset)		
Remedy:	Adjust the offset value accordingly. Note: The alarm is reset as follows: - remove the cause of this alarm. - restart the function generator. See also: p4826 (Function generator offset), p4828 (Function generator lower limit), p4829 (Function generator upper limit)		

A02041	Function generator: Illegal value for bandwidth		
Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	BICO
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high. Depending on the time slice clock cycle, the bandwidth is defined as follows: Bandwidth_max = 1 / (2 x time slice clock cycle) Bandwidth_min = Bandwidth_max / 100000 Example: Assumption: p4830 = 125 µs --> Bandwidth_max = 1 / (2 x 125 µs) = 4000 Hz --> Bandwidth_min = 4000 Hz / 100000 = 0.04 Hz Note: p4823: Function generator bandwidth p4830: Function generator time slice clock cycle See also: p4823 (Function generator bandwidth), p4830 (Function generator time slice cycle)		
Remedy:	Check the value for the bandwidth and adapt accordingly. Note: The alarm is reset as follows: - remove the cause of this alarm. - restart the function generator.

Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	All objects
Component:	None
Reaction:	NONE
Acknowledge:	NONE
Cause:	It is not possible to save the measurement results of a multiple trace on the memory card (trace recorder 0). A multiple trace is not started or is canceled. Alarm value (r2124, interpret decimal): 1: Memory card cannot be accessed. - card is not inserted or is blocked by a mounted USB drive. 3: data save operation too slow. - a second trace has been completed before the measurement results of the first trace were able to be saved. - writing the measurement result files to the card is blocked by the parameter save. 4: Data save operation canceled. - for instance, the file required for the data save operation was not able to be found. See also: p4840 (MTrace cycle number setting)
Remedy:	- insert or remove the memory card. - use a larger memory card. - configure a longer trace time or use an endless trace. - avoid saving parameters while a multiple trace is running. - check whether other functions are presently accessing measurement result files.

A02100 Drive: Computing dead time current controller too short

Message value: %1
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: All objects
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: The value in p0118 produces a dead time of one clock cycle because it is prior to setpoint availability.
Possible causes:
- a parameter backup with a version higher than 4.3 was loaded to a version less than or equal to 4.3.
- the system properties after replacing a component no longer match the parameter assignment.
Alarm value (r2134, floating point):
Minimum value for p0118 where dead time no longer occurs.
Remedy:
- set p0118 to zero.
- set p0118 to a value greater than or equal to the alarm value (for p1810.11 = 1)
- set p0117 (from the device) to an automatic setting (p0117 = 1).
- check the firmware versions of the components involved.

Cause:	Alarm threshold for overtemperature of the power semiconductor in the AC converter has been reached. Note: - the response is set using p0290. - if the temperature of the barrier layer increases by the value set in p0292[1], then fault F30025 is initiated.		
Remedy:	Check the following: - is the ambient temperature within the defined limit values? - have the load conditions and the load duty cycle been appropriately dimensioned? - has the cooling failed? - pulse frequency too high? Note: If the alarm occurs after reducing the current controller sampling time (p0115[0]) during the motor data identification (standstill measurement), then it is recommended that this is initially performed using the standard sampling time and then the sampling time should be subsequently changed over. F06000

Infeed: Precharging monitoring time expired

Message value: -

Message class: Infeed faulted (13)

Drive object: B_INF

Component: Power Module

Propagation: GLOBAL

Reaction: OFF2 (OFF1)

Acknowledge: IMMEDIATELY

Cause: After the line contactor closes the power unit does not signal the READY state within the monitoring time (p0857).

The end of the DC link precharging was not able to be completed for one of the following reasons:

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The precharging resistors are overheated as there were too many precharging operations per time unit.
- 6) The precharging resistors are overheated as the DC link capacitance is too high.
- 7) The precharging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The precharging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The precharging circuit is possibly defective (only for chassis units).

See also: p0210 (Drive unit line supply voltage), p0857 (Power unit monitoring time)

Remedy:

In general:

- check the line supply voltage at the connecting terminals.
 - check the line supply voltage setting (p0210).
 - check the monitoring time and, if required, increase (p0857).
 - where relevant, observe additional power unit messages/signals (e.g. F30027).
 - the following applies to booksize units: Wait (approx. 8 min.) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
- For 5):
- carefully observe the permissible precharging frequency (refer to the appropriate Equipment Manual).
- For 6):
- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Equipment Manual)
- For 7):
- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link
- For 8):
- check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.
- For 9):
- check the DC link for ground faults or short circuits.

Reaction: OFF2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The smoothed sum of the phase currents ($i_1 + i_2 + i_3$) is impermissibly high. The total current has exceeded the parameterized threshold for the ground fault monitoring (p0287).
Possible causes:
- there is a ground fault that results in a high summation current (r0069.6). The DC component in the line currents can damage/destroy the power unit, reactor, filter or motor!
- the current measurement in the power unit is defective.
Fault value (r0949, floating point):
Smoothed total of the phase currents.

Remedy: - check the line supply for ground faults and remove any that are present.
- check the set threshold for the ground fault monitoring (p0287).
- if required, replace the power unit.

F06311 Infeed: Supply voltage (p0210) incorrect

Message value: Line supply voltage: %1
Message class: Network fault (2)
Drive object: B_INF
Component: None **Propagation:** GLOBAL
Reaction: OFF2 (OFF1)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The line voltage nominal value indicated in p0210 is outside the nominal voltage range of the power unit.
After precharging was completed, the actual line supply voltage Vrms was calculated using the measured DC link voltage. This voltage Vrms does not lie within the extended tolerance range of the supply voltage set in p0210.
The following applies for the extended tolerance range: $75\% * p0210 < Vrms < 120\% * p0210$
Alarm value (r2124, floating point):
Line supply voltage Vrms present.
See also: p0210 (Drive unit line supply voltage)
Remedy: - check the parameterized supply voltage and if required change (p0210).
- check the line supply voltage.
See also: p0210 (Drive unit line supply voltage)

F06700 (A) Infeed: Switch line contactor for load condition

Message value: -
Message class: Infeed faulted (13)
Drive object: B_INF
Component: Power Module **Propagation:** GLOBAL
Reaction: NONE (OFF2)
Acknowledge: IMMEDIATELY
Cause: For an ON command, the infeed line contactor should be switched under load.
Remedy: - do not load the DC link if the infeed has not issued an operating signal (r0863.0 = 1).
- after the infeed has been switched off, all power units connected to the DC link should be switched off. To realize this, the operating signal of the infeed (r0863.0) must be suitably interconnected.

A06810 (F)	Infeed: DC link voltage alarm threshold fallen below		
Message value:	-		
Message class:	Infeed faulted (13)		
Drive object:	B_INF		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	In operation, the DC link voltage has dropped to below the alarm threshold. The alarm threshold is obtained from the sum of p0279 and r0296. Note: When the alarm threshold is fallen below, this is also indicated using status bit r3405.7. Possible causes: - line supply voltage dip or another line supply fault. - overload of the infeed. - for Active Line Module: Controller incorrectly parameterized. See also: p0279 (DC link voltage offset alarm threshold), r0296 (DC link voltage undervoltage threshold), r3405		
Remedy:	- check the line voltage and line supply quality. - reduce the power drawn, avoid step-like load changes - for Active Line Module: Adapt the controller parameterization (e.g. automatic line supply identification (p3410 = 4, 5)).

Message value:	%1		
Message class:	Braking Module faulted (14)		
Drive object:	B_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The Braking Module signals a fault (1 -> 0) via X21.4 ("booksize" format) or X21.5 ("chassis" format). This signal is wired to a system digital input and correspondingly interconnected using binector input p3866[0...7]. Possible causes: - wiring of the signal or BICO interconnection of the signal source incorrect. - overtemperature - electronics power supply missing. - ground fault/short-circuit. - internal component fault. See also: p3866 (Braking Module fault)		
Remedy:	- check binector input p3866[0...7] and the wiring from terminal X21.4 ("booksize" format) or X21.5 ("chassis" format). - reduce the number of braking operations. - check the 24 V power supply of the component. - check for a ground fault or short circuit. - replace the component if necessary.

Message value: -

Message class: Braking Module faulted (14)

Drive object: B_INF

Component: None

Propagation: GLOBAL

Reaction: OFF2 (NONE, OFF1)

Acknowledge: IMMEDIATELY

Cause: The temperature sensor connected to the braking resistor signals an overtemperature. The Braking Module is still active. If the overtemperature persists for more than 60 s, fault F06908 is output, and the braking module is switched off.

See also: r3687 (Digital Braking Module pre-alarm overtemperature)

Remedy: - reduce the temperature at the sensor.
- check the temperature sensor connection.

Message value: -

Message class: Braking Module faulted (14)

Drive object: B_INF

Component: None

Propagation: GLOBAL

Reaction: OFF2 (OFF1)

Acknowledge: IMMEDIATELY

Cause: Braking module shut down due to overtemperature at the temperature sensor of the braking resistor.

The overtemperature is detected by the sensor for longer than 60 s.

See also: r3688 (Braking Module internal overtemperature shutdown)

Remedy: - reduce the temperature at the sensor.
- check the temperature sensor connection.

F06909 Braking Module internal Vce fault

Message value: %1

Message class: Braking Module faulted (14)

Drive object: B_INF

Component: None

Propagation: GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: In the power unit, the monitoring of the collector-emitter voltage (U_{ce}) of the power semiconductor to control the braking resistor has responded.

Possible causes:

- short circuit at the braking resistor terminals.
- defective power semiconductor in the braking resistor control.

Note:

Under certain circumstances, this fault is also output if a braking resistor is not connected, and the energy is fed back into the Braking Module.

See also: r3689 (Digital Braking Module Uce fault)

Remedy: - connect a braking resistor.
- check the braking resistor connection.
- check the braking resistor.
- carry out a POWER ON (switch-off/switch-on).
- replace the unit.

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: B_INF, VECTOR_G

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: Open-loop/closed-loop control parameters have had to be changed.
Possible causes:

1. As a result of other parameters, they have exceeded the dynamic limits.
2. They cannot be used due to the fact that the hardware detected not having certain features.
3. The value is estimated as the thermal time constant is missing.
4. Motor temperature model 1 is activated as thermal motor protection is missing.

Fault value (r0949, interpret decimal):

Changed parameter number.

340:

The motor and control parameters were automatically calculated (p0340 = 1), because the vector control was subsequently activated as configuration (r0108.2).

611:

The time constant for thermal motor model 1 was estimated.

612:

Cause:

A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit notation.

The values of the parameters were set to the corresponding violated minimum limit/maximum limit or to the factory setting.

Possible causes:

- the steady-state minimum limit/maximum limit or that defined in the application was violated.

Fault value (r0949, parameter):

Acknowledge:

IMMEDIATELY

Cause:

A changeover of units was initiated. This resulted in a violation of a parameter limit

Possible causes for the violation of a parameter limit:

- When rounding off a parameter corresponding to its decimal places, the steady-state minimum limit or maximum limit was violated.

- inaccuracies for the data type "FloatingPoint".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

See also: p0100 (IEC/NEMA Standards), p0349 (System of units motor equivalent circuit diagram data), p0505 (Selecting the system of units), p0595 (Technological unit selection)

- the higher-level control has withdrawn the "master control by PLC" signal.

- data transfer via the fieldbus (master/drive) was interrupted.

Remedy: - check the interconnection of the binector input for "master control by PLC" (p0854).

- check the "master control by PLC" signal and, if required, switch in.

- check the data transfer via the fieldbus (master/drive).

Note:

If the drive should continue to operate after withdrawing "master control by PLC" then fault response must be parameterized to NONE or the message type should be parameterized as alarm.

A07400 (N)	Drive: DC link voltage maximum controller active
Message value:	-
Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	None
Reaction:	NONE
Acknowledge:	NONE
Cause:	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds.

When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value.

See also: r0056 (Status word, closed-loop control), p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (U/f))

Remedy:

If the controller is not to intervene:

- increase the ramp-down times.
- switch off the Vdc_max controller (p1240 = 0 for vector control, p1280 = 0 for U/f control).

If the ramp-down times are not to be changed:

- use a chopper or regenerative feedback unit.

F07417 Drive: Pulse technique not plausible (motor model)

Message value: %1

Message class: Application/technological function faulted (17)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF2 (NONE)

Acknowledge: IMMEDIATELY

Cause: The evaluation of the test pulse response indicated incorrect values.

Fault value (r0949, interpret decimal):

0:

An impermissible pulse technique configuration was detected during ramp-up.

Possible causes:

- the pulse technique was initially selected when the system powered up (p1750.5 = 1) but the power unit component does not support the current oversampling required (see r0192.23). As a consequence, p1750.0 was deselected automatically.

10:

The pulse response is repeatedly implausible.

Possible causes:

- incorrect configuration of the power unit component
- the power unit component is faulty.

20:

For the specified pulse amplitude, the measured pulse response is much higher than the expected value.

Possible causes:

- Strong oscillations have occurred.
- the motor is short-circuited for high frequencies (output filter).
- the motor is damaged.

Remedy: For fault value = 0:

Once the pulse technique has been deselected automatically (p1750.5 = 0), there are two possible options:

- acknowledge the fault and save parameter p1750.5 = 0 -> field-oriented control mode to standstill is not used and replaced by transition to open-loop control at low speeds.
- upgrade the power unit firmware (at least V4.3) -> field-oriented control mode to standstill is available.

For fault value = 10:

With active selection of the pulse technique (p1750.5 = 1):

- POWER ON (switch-off/switch-on) the Control Unit and the power unit together again.

or

- carry out a manual warm restart (p0009 = 30, p0976 = 2, 3).

If this does not solve the problem: Replace the power unit component.

For fault value = 20:

- control parameters might have been adjusted (factory setting, commissioning).
- filters must not be connected between motor and converter/inverter.
- check the motor.

The drive is switched-on with flying restart activated (p1200), and at the same time the ramp-function generator is bypassed (p1122).
Remedy:	- deactivate the holding command for the ramp-function generator (p1141). - do not bypass the ramp-function generator (p1122). - suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6). Note: For sensorless vector control it is not practical to read in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

A07440	EPOS: Jerk time is limited
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR_G
Component:	None
Propagation:	GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The calculation of the jerk time $T_r = \max(p2572, p2573) / p2574$ resulted in an excessively high value so that the jerk time is internally limited to 1000 ms. Note: The alarm is also output if jerk limiting is not active.
Remedy:	- increase the jerk limiting (p2574). - reduce maximum acceleration or maximum deceleration (p2572, p2573).

A07441	LR: Save the position offset of the absolute encoder adjustment
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR_G
Component:	None
Propagation:	GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	The status of the absolute encoder adjustment has changed. In order to permanently save the determined position offset (p2525) and the determined number of the drive data set (p2733), they must be saved in a non-volatile fashion (p0971, p0977). Possible causes: - motor or encoder were replaced (applies to EQN and DQI). - position-relevant parameters were changed. - an encoder that was not adjusted was adjusted (save the project in a non-volatile fashion using "Copy RAM to ROM"). Note: This message is not output when switching-on the axis after having first moved it in the switched-off state, as long as the parameterizable monitoring window was not exited.
Remedy:	Readjust the encoder.

F07442 (A)	LR: Multiturn does not match the modulo range
Message value:	-
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR_G
Component:	None
Propagation:	GLOBAL
Reaction:	OFF1 (OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The ratio between the multiturn resolution and the modulo range (p2576) is not an integer number. This results in the adjustment being set back, as the position actual value cannot be reproduced after switch-off/switch-on.
Remedy:	Make the ration between the multiturn resolution and the modulo range an integer number. The ratio v is calculated as follows: 1. Motor encoder without position tracking $v = (p0421 * p2506 * p0433 * p2505) / (p0432 * p2504 * p2576)$ 2. Motor encoder with position tracking for the measuring gear $v = (p0412 * p2506 * p2505) / (p2504 * p2576)$ 3. Motor encoder with position tracking for the load gear $v = (p2721 * p2506 * p0433) / (p0432 * p2576)$ 4. Motor encoder with position tracking for the load and measuring gear $v = (p2721 * p2506) / p2576$ 5. Direct encoder without position tracking $v = (p0421 * p2506 * p0433) / (p0432 * p2576)$ 6. Direct encoder with position tracking for the measuring gear $v = (p0412 * p2506) / p2576$ Note: With position tracking, it is recommended that p0412 and p2721 are changed See also: p0412 (Measuring gear absolute encoder rotary revolutions virtual), p0432 (Gearbox factor encoder revolutions), p0433 (Gearbox factor motor/load revolutions), p2721 (Load gear rotary absolute encoder revolutions virtual)

Drive object:	B_INF, ENC, VECTOR_G
Component:	None

Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range. For the configured linear axis, the maximum traversing range is defined to be 64x (+/- 32x) of p0421. It should be read in p2721 and interpreted as the number of load revolutions. Note: Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in in p0187[x].
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset position tracking, position (p2720.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

Message value: -
Message class: Application/technological function faulted (17)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: NONE
Cause: In the modes "traversing blocks" or "direct setpoint input/MDI" at the start of motion, the binector input "no intermediate stop/intermediate stop" (BI: p2640) did not have a 1 signal.
Remedy: Connect a 1 signal to the binector input "no intermediate stop/intermediate stop" (BI: p2640) and re-start motion.

F07493	LR: Overflow of the value range for position actual value
Message value:	%1
Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	None
Propagation:	GLOBAL
Reaction:	OFF1 (OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value. Note: For a linear encoder, the following must be maintained: - $p0407 * p2503 / (2^{p0418} * 10^7) < 1$ - $p0407 * p2503 / (2^{p0419} * 10^7) < 1$
Remedy:	If required, reduce the traversing range or position resolution (p2506). Increase the fine resolution of absolute position actual value (p0419). Note for fault value = 3: If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow. For rotary encoders, the maximum possible absolute position (LU) is calculated as follows: 1. Motor encoder without position tracking $p2506 * p0433 * p2505 / (p0432 * p2504)$ $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders 2. Motor encoder with position tracking for measuring gear $p2506 * p0412 * p2505 / p2504$ 3. Motor encoder with position tracking for load gear $p2506 * p2721 * p0433 / p0432$ 4. Motor encoder with position tracking for load and measuring gear $p2506 * p2721$ 5. Direct encoder without position tracking $p2506 * p0433 / p0432$ $p2506 * p0433 * p0421 / p0432$ for multiturn encoders 6. Direct encoder with position tracking for measuring gear $p2506 * p0412$

Cause:	The motor cannot be changed over. Alarm value (r2124, interpret decimal): 1: The contactor for the motor that is presently active cannot be opened, because for a synchronous motor, the speed (r0063) is greater than the speed at the start of field weakening (p0348). As long as r0063 > p0348, the current in the motor does not decay in spite of the pulses being suppressed. 2: The "contactor opened" feedback signal was not detected within 1 s. 3: The "contactor closed" feedback signal was not detected within 1 s.
Remedy:	For alarm value = 1: Set the speed lower than the speed at the start of field weakening (r0063 < p0348). For alarm value = 2, 3: Check the feedback signals of the contactor involved.

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: Encoder 1 **Propagation:** GLOBAL

Reaction: OFF2 (IASC/DCBRK)

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The commutation angle information is missing. This means that synchronous motors cannot be controlled (closed-loop control)
Fault value (r0949, interpret decimal):
yyyyxxxx dec: yyyy = fault cause, xxxx = drive data set
yyyy = 1 dec:
The motor encoder used does not supply an absolute commutation angle.
yyyy = 2 dec:
The selected ratio of the measuring gear does not match the motor pole pair number.

Remedy: For fault cause = 1:
- check the encoder parameterization (p0404).
- use an encoder with track C/D, EnDat interface of Hall sensors.
- use an encoder with sinusoidal A/B track for which the motor pole pair number (r0313) multiplied by the gear ratio (p0432/p0433) is less than the encoder pulse number (p0408) – or is an integer multiple of the encoder pulse number (p0408).
- activate the pole position identification routine (p1982 = 1) for motor encoders without absolute position information. Then, using an encoder adjustment (p1990), the angular commutation offset should be determined.

4.2 List of faults and alarms

For fault cause = 2:

Cause: For position tracking, the configuration is not supported.
 Position tracking can only be activated for absolute encoders.
 For linear axes, it is not possible to simultaneously activate the position tracking for load and measuring gears.
 Fault value (r0949, interpret hexadecimal):
 ddcbbaa hex
 aa = encoder data set
 bb = component number
 cc = drive data set
 dd = fault cause
 dd = 00 hex = 0 dec
 An absolute encoder is not being used.
 dd = 01 hex = 1 dec
 Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM.
 dd = 02 hex = 2 dec
 For a linear axis, the position tracking was activated for the load and measuring gear.
 dd = 03 hex = 3 dec
 Position tracking cannot be activated because position tracking with another gear ratio, axis type or tolerance window has already been detected for this encoder data set.
 dd = 04 hex = 4 dec
 A linear encoder is being used.
 See also: p0404 (Encoder configuration effective), p0411 (Measuring gear configuration)

Remedy:

For fault value 0:
 - use an absolute encoder.

For fault value 1:
 - use a Control Unit with sufficient NVRAM.

For fault value = 2, 4:
 - if necessary, deselect the position tracking (p0411 for the measuring gear, p2720 for the load gear).

For fault value 3:
 - Only activate position tracking of the load gear in the same encoder data set if the gear ratio (p2504, p2505), axis type (p2720.1) and tolerance window (p2722) are also the same. These parameters must be the same in all drive data sets, which use the same motor encoder (p187).

Cause:	A phase-phase short-circuit or ground fault was detected at the motor-side output terminals of the converter. Fault value (r0949, interpret decimal): 0: Problem with the current measurement/current that is impressed 1: Short-circuit, phase UV. 2: Short-circuit, phase UW. 3: Short-circuit, phase VW. 4: Ground fault with overcurrent. 1yxxx: Ground fault with current in phase U detected (y = pulse number, xxxx = component of the current in phase V in per mille). 2yxxx: Ground fault with current in phase V detected (y = pulse number, xxxx = component of the current in phase U in per mille). Note: Also when interchanging the line and motor cables is identified as a motor-side short circuit. The ground fault test only functions when the motor is stationary. Cause:	The code number of the actual power unit does not match the saved number. This only occurs if the comparator in p9906 or p9908 is not at 2 (low) or 3 (minimum). Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)		
Remedy:	- Connect the original power unit and switch on the Control Unit again (POWER ON). - set p0201 to r0200 and exit commissioning with p0010 = 0. Note: If the power unit type was changed (see r0203) or the motor replaced, then the motor must be recommissioned (e.g. using p0010 = 1, p3900 = 3, p1900 = 1, 2). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ. If the new power unit is accepted, then if required, the current limit p0640 can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same). If the comparison stage in p9906 is set to 2, 3, then commissioning can be exited (p0010 = 0) and the fault acknowledged. This procedure is not recommended for different power unit types. Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)		
Remedy:	Connect the original power unit and switch on the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0. For infeeds, the following applies: Line reactors or line filters must be used that are specified for the new power unit. A line supply and DC link identification routine (p3410 = 5) must then be carried out. It is not possible to change the power unit without recommissioning the system if the type of infeed (A_Infeed, B_Infeed, S_Infeed), the type of construction/design (booksize, chassis) or the voltage class differ between the old and new power units.		

For inverters, the following applies:

If the new power unit is accepted, then if required, the current limit (p0640) can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same).

If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ.

F07901 Drive: Motor overspeed

Message value: -
Message class: Application/technological function faulted (17)
Drive object: VECTOR_G
Component: Motor **Propagation:** GLOBAL
Reaction: OFF2 (IASC/DCBRK)
Acknowledge: IMMEDIATELY
Cause: The maximum permissible speed was either positively or negatively exceeded.
The maximum permissible positive speed is formed as follows: Minimum (p1082, CI: p1085) + p2162
The maximum permissible negative speed is formed as follows: Maximum (-p1082, CI: 1088) - p2162
Remedy: The following applies for a positive direction of rotation:
- check r1084 and if required, correct p1082, CI:p1085 and p2162.
The following applies for a negative direction of rotation:
- check r1087 and if required, correct p1082, CI:p1088 and p2162.
Activate precontrol of the speed limiting controller (p1401.7 = 1).
Increase the hysteresis for the overspeed signal p2162. This upper limit is dependent upon the maximum motor speed p0322 and the maximum speed p1082 of the setpoint channel.

F07902 (N, A) Drive: Motor stalled

Message value: %1
Message class: Application/technological function faulted (17)
Drive object: VECTOR_G
Component: Motor **Propagation:** GLOBAL
Reaction: OFF2 (IASC/DCBRK, NONE, OFF1, OFF3, STOP2)
Acknowledge: IMMEDIATELY
Cause: The system has identified that the motor has stalled for a time longer than is set in p2178.
Fault value (r0949, interpret decimal):
1: Stall detection using r1408.11 (p1744, p0492).
2: Stall detection using r1408.12 (p1745) or via the flux difference (r0083 ... r0084).
3: Stall detection using r0056.11 (only for separately excited synchronous motors).
See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)
Remedy: It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990).
For closed-loop speed and torque control with speed encoder, the following applies:
- check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft).
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover.
If there is no fault, then the fault tolerance (p1744 or p0492) can be increased. For resolvers with a high signal ripple, for example p0492 should be increased and the speed signal smoothed (p1441, p1442).
If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 x p0311; p1753 = 5 %).
- check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover.
For closed-loop speed and torque control without speed encoder, the following applies:
- Check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750.2 = 1 (sensorless vector control to standstill for passive loads).
- if the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401).

- check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again.

- if there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased.

The following generally apply for closed-loop and torque control:

- check whether the motor cables are disconnected.

- check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized.

- if the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and flux actual value can be reduced and, in turn, the message prevented, by reducing p1596 or p1553.

For separately excited synchronous motors (closed-loop control with speed encoder), the following applies:

- check the speed signal (interrupted cable, polarity, pulse number).

- ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters).

- check the excitation equipment and the interface to the closed-loop control.

- encoder the highest possible dynamic response of the closed-loop excitation current control.

- check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter.

- do not exceed the maximum speed (p2162).

If there is no fault, then the delay time can be increased (p2178).

A07903 Drive: Motor speed deviation

Message value: -

Message class: Application/technological function faulted (17)

Drive object: VECTOR_G

Component: Motor

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The absolute value of the speed difference from the two setpoints (p2151, p2154) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166).

The alarm is only enabled for p2149.0 = 1.

Possible causes could be:

- the load torque is greater than the torque setpoint.

- when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small.

- for closed-loop torque control, the speed setpoint does not track the speed actual value.

- for active Vdc controller.

For U/f control, the overload condition is detected as the I_{max} controller is active.

See also: p2149 (Monitoring configuration)

Remedy: - increase p2163 and/or p2166.

- increase the torque/current/power limits.

- for closed-loop torque control: The speed setpoint should track the speed actual value.

- deactivate alarm with p2149.0 = 0.

zzzz = 00CB hex = 203 dec:
Internal voltage protection: The motor short-circuit current (p0320) is greater than the maximum motor current (p0323).

zzzz = 00CC hex = 204 dec:

Internal voltage protection: The activation (p1231 = 4) is not given for all motor data sets with synchronous motors (p0300 = 2xx, 4xx).

Remedy:

For fault value = 1:

- an armature short-circuit / voltage protection is only permissible for permanent-magnetic synchronous motors. The highest position of the motor type in p0300 must either be 2 or 4.

For fault value = 101:

- the contactor for the external armature short-circuit configuration should be controlled using output signal r1239.0. For instance, the signal can be connected to an output terminal via binector input p0738. Before this fault can be acknowledged, p1231 must be set again.

For fault value = 102:

- if the external armature short circuit is selected with contactor feedback signal (p1231 = 1), then the feedback signal must be connected to an input terminal (e.g. r0722.x) and then interconnected to binector input p1235.

- alternatively, the external armature short-circuit without contactor feedback signal (p1231 = 2) can be selected.

For fault value = 103:

- if the external armature short-circuit without contactor feedback signal (p1231 = 2) is selected, then a delay time must be parameterized in p1237. This time must always be greater than the actual contactor opening time, as otherwise the Motor Module would be short-circuited!

For fault value = 201:

- a Motor Module with a higher maximum current or a motor with a lower short-circuit current must be used. The maximum Motor Module current must be higher than 1.8 x short-circuit current of the motor.

For fault value = 202:

- for internal voltage protection, use a Motor Module in booksize or chassis format.

For fault value = 203:

- for internal voltage protection, only use short-circuit proof motors.

For fault value = 204:

- the internal voltage protection must either be activated for all motor data sets with synchronous motors (p0300 = 2xx, 4xx) (p1231 = 3) or it must be deactivated for all motor data sets (p1231 not equal to 3). This therefore ensures that the protection cannot be accidentally withdrawn as a result of a data set changeover. The fault can only be acknowledged if this condition is fulfilled.

F07907**Internal armature short-circuit: Motor terminals are not at zero potential after pulse suppression**

-

Message class:

Application/technological function faulted (17)

Drive object:

VECTOR_G

Component:

Power Module

Propagation:

GLOBAL

Reaction:

NONE

Acknowledge:

IMMEDIATELY

Cause:

The function "Internal voltage protection" (p1231 = 3) was activated.

The following must be observed:

- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)!

- it is only permissible to use motors that are short-circuit proof (p0320 < p0323).

- the Motor Module must be able to continually conduct 180% short-circuit current (r0331) of the motor (r0289).

- the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.

- if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.

- if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.

- if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).

A07927	DC braking active
Message value:	-
Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	Motor
Propagation:	GLOBAL
Reaction:	NONE

Cause:	The motor is braked with DC current. DC braking is active. 1) A message with response DCBRK is active. The motor is braked with the braking current set in p1232 for the duration set in in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC braking set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	Not necessary. This alarm is automatically withdrawn after DC braking.

F07928	Internal voltage protection initiated
Message value:	-
Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	Power Module
Propagation:	GLOBAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).
Remedy:	If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is re-activated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active (r1239.5 = 1) and the line supply returns (450 V < DC link voltage < 800 V), the armature short-circuit is withdrawn after 3 minutes.

Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	Motor
Propagation:	GLOBAL
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The Control Unit has detected a brake control error. - motor cable is not shielded correctly. - defect in the brake control circuit of the Motor Module. Fault value (r0949, interpret decimal): 10, 11: Fault in "open holding brake" operation. - no brake connected or wire breakage (check whether brake opens for p1278 = 1). - ground fault in brake cable. - S120M: brake opened via terminal X4.1 for mounting purposes (this is only permissible when the power supply voltage is switched off). 20: Fault in "brake open" state. - short-circuit in brake winding. 30, 31: Fault in "close holding brake" operation. - no brake connected or wire breakage (check whether brake opens for p1278 = 1). - short-circuit in brake winding. 40: Fault in "brake closed" state. 50: Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control diagnostics). 80: When using the Safe Brake Adapter (SBA), a fault has occurred in the brake control of the Control Unit. See also: p1278 (Brake control diagnostics evaluation)
Remedy:	- check the motor holding brake connection. - for a parallel connection, check the setting of the power unit data set to control the holding brake (p7015). - check the function of the motor holding brake. - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.

- check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).

- replace the Motor Module involved.

Operation with Safe Brake Module:

- check the Safe Brake Module connection.

- replace the Safe Brake Module.

Operation with Safe Brake Adapter (SBA):

- check the SBA connection and if required, replace the SBA.

F07934 (N)**Drive: S120 Combi motor holding brake configuration**

Message value: %1

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: None

Propagation: GLOBAL

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

A connected motor holding brake has been detected with an S120 Combi. However, this brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly).

Fault value (r0949, interpret decimal):

0: No motor holding brake is assigned (p1215 = 0 or 3 on all S120 Combi feed drives).

1: More than one motor holding brake has been assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive)

- or there is more than one DRIVE-CLiQ motor with motor holding brake.

4 Faults and alarms

4.2 List of faults and alarms

2: Brake was accidentally assigned to the spindle (p1215 = 1); this is not permitted for this software release.
3: An attempt was made to enable the function "Safe Brake Control" (SBC, p9602 = p9802 = 1) for the spindle. This is not permitted for this software release.

Remedy: Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2).

The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: None

Propagation: GLOBAL

Reaction: NONE (OFF1, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: An incorrect motor holding brake configuration was detected.

Fault value (r0949, interpret decimal):

0:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was set to "motor holding brake the same as sequence control" (p1215 = 1) (only when commissioning for the first time).

For a chassis unit with Safe Brake Adapter (SBA), the interconnection p9621 = r9872.3 was established (only when commissioning for the first time).

For a parallel connection, the power unit was set in p7015, to which the motor holding brake is connected (only when commissioning for the first time).

1:

A motor holding brake was detected where the brake control has not been configured (p1215 = 0).

The brake control configuration was left at "No motor holding brake available" (p1215 = 0).

11:

The identification had detected more than one motor holding brake for a parallel connection.

12:

For the parallel connection, in p0121 there is no valid component number for the power unit data set that is set in p7015.

13:

With the "Safe Brake Control" (SBC) function activated, an attempt was made to change the value in p7015.

14:

For a parallel connection, the power units set in p7015 cannot be addressed.

Remedy: For fault value = 0:

- no remedy required.

For fault value = 1:

- if required change the motor holding brake configuration (p1215 = 1, 2).

- if this fault value unexpectedly occurs, then the motor connections should be checked in order to rule out that they have been interchanged.

For fault value = 11:

For a parallel connection, only connect one motor holding brake.

For fault value = 12:

Check the setting of the power unit data set for a parallel connection (p7015).

For fault value = 13:

Before changing p7015, deactivate the "Safe Brake Control" function (SBC) (p9602).

For fault value = 14:

Check whether the power unit supports the brake control for a parallel connection (r9771.14).

Check whether there is a DRIVE-CLiQ communication error between the Control Unit and the power unit involved and, if required, carry out a diagnostics routine for the faults identified.

Acknowledge: IMMEDIATELY

Cause: The absolute value of the speed difference from the two actual values (r2169, r1443) exceeds the tolerance threshold (p3236) for longer than permitted (p3238).
Possible causes:
- the interconnection or scaling of the external encoder signal is incorrect (p1440, p2000).
- speed encoder for external encoder signal faulty.
- encoder signal's polarity or gain incorrect.
- smoothing time constant for model speed for monitoring too high (p2157).
- smoothing time constant or threshold values for monitoring too low (p3236, p3238).
If an external encoder signal is not being used:
- check speed signal r0061. For significant signal ripple, check the speed encoder and if required increase p0492.
See also: p2149 (Monitoring configuration)

Remedy:
- check that the external speed matches the motor speed (p1440, r1443).

Message value: %1

Message class: Application/technological function faulted (17)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: An error occurred when synchronizing the drive to the line supply.
Fault value (r0949, interpret binary):
Bit 0 = 1:
- after synchronization has been completed, the phase difference (r3808) is greater than the threshold value for phase synchronism (p3813) for longer than 1 second.
Bit 1 = 1:
- while synchronizing the motor to the line supply, an OFF1 or OFF3 response occurred.
- the enable was withdrawn while synchronizing (p3802 = 0)
Bit 2 = 1:
- within the time limit (p3818), the phase difference was not able to be continuously limited to the threshold value.

Remedy:
For bit 0, 2 = 1:
- if required increase the threshold value for phase synchronism (p3813) for synchronizing the drive to the line supply.
- increase the phase controller limiting (p3811).
- increase the threshold value for the frequency difference (p3806).
For bit 1 = 1:

Cause:	The conditions to record the friction characteristic are not fulfilled. Fault value (r0949, interpret decimal): 0046: Missing enable signals (r0046). 1082: The highest speed value to be approached (p3829) is greater than the maximum speed (p1082). 1084: The highest speed value to be approached (p3829) is greater than the maximum speed (r1084, p1083, p1085). 1087: The highest speed value to be approached (p3829) is greater than the maximum speed (r1087, p1086, p1088). 1110: Friction characteristic record, negative direction selected (p3845) and negative direction inhibited (p1110). 1111: Friction characteristic record, positive direction selected (p3845) and positive direction inhibited (p1111). 1198: Friction characteristic record selected (p3845 > 0) and negative (p1110) and positive directions (p1111) inhibited (r1198). 1300: The control mode (p1300) has not been set to closed-loop speed control. 1755: For encoderless closed-loop control (p1300 = 20), the lowest speed value to be approached (p3820) is less than or equal to the changeover speed, open-loop controlled operation (p1755). 1910: Motor data identification activated. 1960: Speed controller optimization activated. 3820 ... 3829: speed (p382x) cannot be approached. 3840: Friction characteristic incorrect. 3845: Friction characteristic record deselected.
Remedy:	Fulfill the conditions to record the friction characteristic. For fault value = 0046: - establish missing enable signals. For fault value = 1082, 1084, 1087: - Select the highest speed value to be approached (p3829) less than or equal to the maximum speed (p1082, r1084, r1087). - Re-calculate the speed points along the friction characteristic (p0340 = 5). For fault value = 1110: - Select the friction characteristic record, positive direction (p3845). For fault value = 1111: - Select the friction characteristic record, negative direction (p3845). For fault value = 1198: - Enable the permitted direction (p1110, p1111, r1198). For fault value = 1300: - set the control mode (p1300) on the closed-loop speed control (p1300 = 20, 21).

For fault value = 1755:

- For encoderless closed-loop speed control (p1300 = 20) select the lowest speed value to be approached (p3820) greater than the changeover speed of open-loop controlled operation (p1755).
- Re-calculate the speed points along the friction characteristic (p0340 = 5).

For fault value = 1910:

- Exit the motor data identification routine (p1910).

For fault value = 1960:

- Exit the speed controller optimization routine (p1960).

For fault value 3820 ... 3829:

- check the load at speed p382x.
- check the speed signal (r0063) for oscillation at speed p382x. Check the settings of the speed controller if applicable.

For fault value = 3840:

- Make the friction characteristic error-free (p3820 ... p3829, p3830 ... p3839, p3840).

For fault value = 3845:

- Activate the friction characteristic record (p3845).

Component: None **Propagation:** GLOBAL
Reaction: OFF1 (NONE, OFF2)
Acknowledge: IMMEDIATELY
Cause: A fault has occurred during the encoder test.
Fault value (r0949, interpret decimal):
1: The speed did not reach a steady-state condition.
2: The speed setpoint was not able to be approached as the minimum limiting is active.
3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
4: The speed setpoint was not able to be approached as the maximum limiting is active.
5: The encoder does not supply a signal.
6: Incorrect polarity.
7: Incorrect pulse number.
8: Noise in the encoder signal or speed controller unstable.
9: Voltage Sensing Module (VSM) incorrectly connected.
Remedy: For fault value = 1:
- check the motor parameters.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).
For fault value = 2:
- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).
For fault value = 3:
- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).
For fault value = 4:
- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).
For fault value = 5:
- check the encoder connection. If required, replace the encoder.
For fault value = 6:
- check the connection assignment of the encoder cable. Adapt the polarity (p0410).
For fault value = 7:
- adapt the pulse number (p0408).

For fault value = 8:

- check the encoder connection and encoder cable. It is possible that there is a problem associated with the ground connection.
- reduce the dynamic response of the speed controller (p1460, p1462 and p1470, p1472).

For fault value = 9:

None

Propagation:

GLOBAL

Reaction:

IMMEDIATELY

Cause:

A fault has occurred while determining the saturation characteristic.

Fault value (r0949, interpret decimal):

- 1: The speed did not reach a steady-state condition.
- 2: The rotor flux did not reach a steady-state condition.
- 3: The adaptation circuit did not reach a steady-state condition.
- 4: The adaptation circuit was not enabled.
- 5: Field weakening active.
- 6: The speed setpoint was not able to be approached as the minimum limiting is active.
- 7: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
- 8: The speed setpoint was not able to be approached as the maximum limiting is active.
- 9: Several values of the determined saturation characteristic are not plausible.
- 10: Saturation characteristic could not be sensibly determined because load torque too high.

Remedy:

For fault value = 1:

- the total drive moment of inertia is far higher than that of the motor (p0341, p0342).

Deselect rotating measurement (p1960), enter the moment of inertia p0342, re-calculate the speed controller p0340 = 4 and repeat the measurement.

For fault value = 1 ... 2:

- increase the measuring speed (p1961) and repeat the measurement.

For fault value = 1 ... 4:

- check the motor parameters (rating plate data). After the change: Calculate p0340 = 3.
- check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).

For fault value = 5:

- the speed setpoint (p1961) is too high. Reduce the speed.

For fault value = 6:

- adapt the speed setpoint (p1961) or minimum limiting (p1080).

For fault value = 7:

- adapt the speed setpoint (p1961) or suppression (skip) bandwidths (p1091 ... p1094, p1101).

For fault value = 8:

- adapt the speed setpoint (p1961) or maximum limit (p1082, p1083 and p1086).

For fault value = 9, 10:

- the measurement was carried out at an operating point where the load torque is too high. Select a more suitable operating point, either by changing the speed setpoint (p1961) or by reducing the load torque. The load torque may not be varied while making measurements.

Note:

The saturation characteristic identification routine can be disabled using p1959.1.

Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: Torque limits too low for a torque step. 6: No suitable speed controller setting was found.
Remedy:	For fault value = 1: - check the motor parameters (rating plate data). After the change: Calculate p0340 = 3. - check the moment of inertia (p0341, p0342). After the change: Calculate p0340 = 3. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). For fault value = 3: - adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1101). For fault value = 4: - adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086). For fault value = 5: - increase the torque limits (e.g. p1520, p1521). For fault value = 6: - reduce the dynamic factor (p1967). - disable the vibration test (p1959.4 = 0) and repeat the rotating measurement. See also: p1959 (Rotating measurement configuration)

Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	VECTOR_G
Component:	None
Propagation:	GLOBAL
Reaction:	OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	An error has occurred while measuring the dynamic leakage inductance. Fault value (r0949, interpret decimal): 1: The speed did not reach a steady-state condition. 2: The speed setpoint was not able to be approached as the minimum limiting is active. 3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active. 4: The speed setpoint was not able to be approached as the maximum limiting is active. 5: The 100% flux setpoint was not reached. 6: No Lq measurement possible because field weakening is active. 7: Speed actual value exceeds the maximum speed p1082 or 75% of the rated motor speed. 8: Speed actual value is below 2 % of the rated motor speed.
Remedy:	For fault value = 1: - check the motor parameters. - carry out a motor data identification routine (p1910). - if required, reduce the dynamic factor (p1967 < 25 %). For fault value = 2: - adapt the speed setpoint (p1965) or adapt the minimum limit (p1080). For fault value = 3: - adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101). For fault value = 4: - adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086). For fault value = 5: - flux setpoint p1570 = 100 % and current setpoint p1610 = 0 % kept during the Lq measurement. For fault value = 6: - reduce the regenerative load so that the drive does not reach field weakening when accelerating. - reduce p1965 so that the q leakage inductance is recorded at lower speeds. For fault value = 7: - increase p1082, if this is technically permissible. - reduce p1965 so that the q leakage inductance is recorded at lower speeds. For fault value = 8: - reduce the load when motoring so that the drive is not braked. - increase p1965 so that the measurement may be taken at higher speeds. Note: The measurement of the q leakage inductance can be disabled using p1959.5. If only p1959.5 is set, then only this measurement is carried out if p1960 is set to 1, 2 and the drive is switched on. See also: p1959 (Rotating measurement configuration)

Cause:	A fault has occurred during the identification routine. Separately excited synchronous motors: stator reactance outside 20 ... 500 % of Zn. 5: Identified magnetizing reactance lies outside the expected range 50 ... 900 % of Zn. Separately excited synchronous motors: magnetizing reactance outside 20 ... 500 % of Zn. 6: Identified rotor time constant lies outside the expected range 10 ms ... 5 s. Separately excited synchronous motors: damping time constant outside of 5 ms ... 1 s. 7: Identified total leakage reactance lies outside the expected range 4 ... 100 % of Zn. 8: Identified stator leakage reactance lies outside the expected range 2 ... 50% of Zn. Separately excited synchronous motors: stator leakage reactance outside 2 ... 40 % of Zn. 9: Identified rotor leakage reactance lies outside the expected range 2 ... 50% of Zn. Separately excited synchronous motors: damping leakage reactance outside 1.5 ... 20 % of Zn. 10: Motor has been incorrectly connected. 11: Motor shaft rotates. 12: Ground fault detected. 15: Pulse inhibit occurred during motor data identification. 16: During the Rs measurement an error occurred when activating one or several power modules connected in parallel. 17: After the Rs measurement an error occurred when activating one or several power modules connected in parallel. 20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V. 30: Current controller in voltage limiting. 40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies. 50: The selected sampling time is too low for the motor identification (p0115[0]). 70: Identification of the circle center point canceled (reluctance motor). Note: Percentage values are referred to the rated motor impedance: $Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$
Remedy:	For fault value = 1 ... 40: - check whether motor data have been correctly entered in p0300, p0304 ... p0311. - is there an appropriate relationship between the motor power rating and that of the Motor Module? The ratio of the Motor Module to the rated motor current should not be less than 0.5 and not be greater than 4. - check connection type (star-delta). For fault value = 11 in addition: - deactivate oscillation monitoring (p1909.7 = 1). For fault value = 2: - for parallel circuits, check the motor winding system in p7003. If, for power units connected in parallel, a motor is specified with a single-winding system (p7003 = 0), although a multi-winding system is being used, then a large proportion of the stator resistance is interpreted as feeder cable resistance and entered in p0352. For fault value = 4, 7: - check whether inductances are correctly set in p0233 and p0353. - check whether motor has been correctly connected (star-delta). - set p1909.0 = 1.

- For fault value = 12:
 - check the power cable connections.
 - check the motor.
 - check the CT.
- For fault value = 50:
 - perform a motor data identification with a higher sampling time, and after this, change to the required higher sampling time (p0115[0]).

A08565	PNCOMM BOARD: Consistency error affecting adjustable parameters		
Message value:	%1		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	A consistency error was detected when activating the configuration (p8945) for the Communication Board Ethernet 20/25 (CBE20/CBE25). Alarm value (r2124, interpret decimal): 0: general consistency error 1: error in the IP configuration (IP address, subnet mask or standard gateway). 2: Error in the station names. 3: DHCP was not able to be activated, as a cyclic PROFINET connection already exists. 4: a cyclic PROFINET connection is not possible as DHCP is activated. Note: For all alarm values, the following applies: currently set configuration has not been activated. DHCP: Dynamic Host Configuration Protocol See also: p8940 (CBE2x Name of Station), p8941 (CBE2x IP address), p8942 (CBE2x Default Gateway), p8943 (CBE2x Subnet Mask), p8944 (CBE2x DHCP Mode)		
Remedy:	- check the required interface configuration (p8940 and following), correct if necessary, and activate (p8945). or - reinitialize the station using the "Edit Ethernet node" screen form (e.g. with STARTER commissioning tool). See also: p8945 (CBE2x activate interface configuration)

Drive object:	All objects		
Component:	None	Propagation:	GLOBAL
Reaction:	Vector: OFF3 (NONE, OFF1, OFF2) Infeed: NONE (OFF1, OFF2)		
Acknowledge:	IMMEDIATELY		
Cause:	A CAN communications error has occurred. Fault value (r0949, interpret decimal): 1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller. - bus cable short circuit. - incorrect baud rate. - incorrect bit timing. 2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]). - bus cable interrupted. - bus cable not connected. - incorrect baud rate. - incorrect bit timing. - master fault. Note: The fault response can be set as required using p8641. See also: p8604 (CAN life guarding), p8641 (CAN Abort Connection Option Code)		
Remedy:	- check the bus cable - check the baud rate (p8622). - check the bit timing (p8623). - check the master.

Propagation: GLOBAL

Reaction: Vector: OFF3

Infeed: OFF2

Acknowledge: IMMEDIATELY

Cause: A CANopen NMT state transition from "operational" to "pre-operational" or after "stopped".

Fault value (r0949, interpret decimal):

1: CANopen NMT state transition from "operational" to "pre-operational".

2: CANopen NMT state transition from "operational" to "stopped".

Note:

In the NMT state "pre-operational", process data cannot be transferred and in the NMT state "stopped", no process data and no service data can be transferred.

Remedy: Not necessary.

Message value: %1

Message class: Power electronics faulted (5)

Drive object: VECTOR_G

Component: Power Module

Propagation: LOCAL

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit was overloaded (r0036 = 100 %).

- the permissible rated power unit current was exceeded for an inadmissibly long time.

- the permissible load duty cycle was not maintained.

Fault value (r0949, interpret decimal):

I2t [100 % = 16384].

Remedy:

- reduce the continuous load.

- adapt the load duty cycle.

- check the motor and power unit rated currents.

- increase p0294

F30006 Power unit: Thyristor Control Board

Message value: -
Message class: Power electronics faulted (5)
Drive object: B_INF, VECTOR_G
Component: Power Module **Propagation:** LOCAL
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The Thyristor Control Board (TCB) of the Basic Line Module signals a fault.
- there is no line supply voltage.
- the line contactor is not closed.
- the line supply voltage is too low.
- line supply frequency outside the permissible range (45 ... 66 Hz).
- there is a DC link short-circuit.
- there is a DC link short-circuit (during the precharging phase).
- the motor either has a short-circuit or insulation fault (from an inverter connected to the DC link).
- voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V.
- there is an internal fault in the Thyristor Control Board.
Remedy: The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s!
- check the line supply voltage
- check or energize the line contactor.
- check the monitoring time and, if required, increase (p0857).
- if required, observe additional power unit messages/signals.
- check the DC link regarding short-circuit or ground fault.
- check the motor regarding short-circuit or ground fault.
- evaluate diagnostic LEDs for the Thyristor Control Board.

F30015 (N, A)	Power unit: Phase failure motor cable
Message value:	-
Message class:	Application/technological function faulted (17)
Drive object:	VECTOR_G
Component:	Motor
Propagation:	GLOBAL
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	A phase failure in the motor feeder cable was detected. The signal can also be output in the following cases: - the motor is correctly connected, but the drive has stalled in U/f control. In this case, a current of 0 A is possibly measured in one phase due to asymmetry of the currents. - the motor is correctly connected, however the closed-speed control is instable and therefore an oscillating torque is generated. Note: Chassis power units do not feature phase failure monitoring.
Remedy:	- check the motor feeder cables. - increase the ramp-up or ramp-down time (p1120) if the drive has stalled in U/f control. - check the speed controller settings.

F30017	Power unit: Hardware current limit has responded too often
Message value:	Fault cause: %1 bin
Message class:	Power electronics faulted (5)
Drive object:	B_INF, VECTOR_G
Component:	Power Module
Propagation:	LOCAL
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit. For infeed units, the following applies: - closed-loop control is incorrectly parameterized. - load on the infeed is too high. - Voltage Sensing Module incorrectly connected. - line reactor missing or the incorrect type. - power unit defective.

The following applies to Motor Modules:

- closed-loop control is incorrectly parameterized.
- fault in the motor or in the power cables.
- the power cables exceed the maximum permissible length.
- motor load too high
- power unit defective.

Fault value (r0949, interpret binary):

Bit 3: phase U

Bit 4: phase V

Bit 5: phase W

Additional bits:

Only for internal Siemens troubleshooting.

Note:

Fault value = 0 means that the phase with current limiting is not recognized (e.g. for blocksize device).

Remedy:

For infeed units, the following applies:

- check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5)
- reduce the load and increase the DC link capacitance or use a higher-rating infeed if necessary
- check the connection of the optional Voltage Sensing Module
- check the connection and technical data of the line reactor
- check the power cables for short-circuit or ground fault.
- replace power unit.

The following applies to Motor Modules:

- check the motor data and if required, recalculate the controller parameters (p0340 = 3). As an alternative, run a motor data identification (p1910 = 1, p1960 = 1).
- check the motor circuit configuration (star-delta).
- check the motor load.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

Power unit: Configuration not supported

Message value:

fault cause: %1, additional information: %2

Message class:

Error in the parameterization / configuration / commissioning procedure (18)

Drive object:

B_INF, VECTOR_G

Component:

Power Module

Propagation:

LOCAL

Reaction:

OFF2

Acknowledge:

IMMEDIATELY

Cause:

A configuration is requested that is not supported by the power unit.

Fault value (r0949, interpret hexadecimal):

yyyyxxxx hex: xxxx = fault cause, yyyy = additional information (internal Siemens)

xxxx = 0: Autonomous operation is requested but is not supported.

xxxx = 1: The requested DRIVE-CLiQ timing is not permissible.

xxxx = 2: A PM260 has been detected with PS-ASIC version 2. This combination is not supported.

xxxx = 3: Initialization was not able to be successfully completed. It is possible that the Control Unit was withdrawn from the Power Module before or during power up.

xxxx = 4: The combination of power unit and Control Unit or Control Unit Adapter is not supported.

xxxx = 5: The higher current controller dynamic performance is not supported.

xxxx = 6: it is not permitted to operate the Motor Module with this Control Unit and firmware version.

Remedy:

For fault cause = 0:

If required, deactivate an active internal voltage protection (p1231).

For fault cause = 1:

Update the Control Unit firmware or change the DRIVE-CLiQ topology.

For fault cause = 2:

Replace the power unit with a PM260 with PS-ASIC version 3 (or higher).

For fault cause = 3, 4:

Insert a Control Unit or Control Unit Adapter (CUAxx) on an appropriate Power Module and perform a POWER ON for the Control Unit or the Control Unit Adapter.

For fault cause = 5:

- use a booksize format power unit.
- for a Double Motor Module operate the two drive controls with the same current controller sampling time (p0115[0]). Otherwise, the higher current controller dynamics can only be activated on the drive with the longer sampling time.
- if required, deselect the higher current controller dynamic performance (p1810.11 = 0). After deselecting the computing dead time, recalculate the controller gains (p0340 = 4). If required, optimize the speed controller.

For fault cause = 6:

- use a suitable Motor Module.
- use a Control Unit with approved firmware version.

Remedy: See also: p0210 (Drive unit line supply voltage)
 In general:
 - check the line supply voltage at the input terminals.
 - check the line supply voltage setting (p0210).
 For booksize drive units, the following applies:
 - wait (approx. 8 minutes) until the precharging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.
 For 5):
 - carefully observe the permissible precharging frequency (refer to the appropriate Manual).
 For 6):
 - check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC link capacitance if necessary (refer to the appropriate Manual).
 For 7):
 - interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link
 For 8):
 - check the connections of the external line contactor. The line contactor must be open during DC link fast discharge.
 For 9):
 - check the DC link for ground faults or short circuits.
 For 11):
 - check the DC link voltage of the infeed (r0070) and Motor Modules (r0070).
 If the DC link voltage generated by the infeed (or external) is not displayed for the Motor Modules (r0070), then a fuse has ruptured in the Motor Module.

A30048 Power unit: fan defective

Message value: Fault cause: %1 bin

Message class: External measured value / signal state outside the permissible range (16)

Drive object: B_INF, VECTOR_G

Component: Power Module

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The feedback signal from a fan indicates a fault.

- fan defective.
- fan blocked.
- feedback signal inaccurate.
- fan power supply interrupted (only for r0193.13 = 1 and heat sink fan)

Alarm value (r2124, interpret binary):
Bit 0 = 1: heat sink fan
Bit 1 = 1: fan inside the device

Note:

- for firmware version < 5.1 of the power unit, the alarm value is always 0. The alarm then refers to the heat sink fan.
- for r0193.13 = 1, fault F30058 is output instead of this alarm for heat sink fans, if the pulses are inhibited or the fault occurs within 10 s after the fan runs up when the pulses are enabled.
- for r0193.13 = 1, fault F30059 is output instead of this alarm for fans inside the unit, if the air intake temperature (r0037[3]) has exceeded a specific threshold.

Remedy:

- check the fan involved.
- if required, replace the fan.
- check the fan power supply and if required switch on (only for r0193.13 = 1 and heat sink fan).

Note:

If the alarm has been withdrawn, this does not necessarily mean that the cause of the fault has been resolved. It is also possible that the software switched off the fan, and therefore can no longer evaluate the feedback signal.

A30057 Power unit: Line asymmetry

Message value: %1
Message class: Network fault (2)
Drive object: B_INF, VECTOR_G
Component: Power Module **Propagation:** LOCAL
Reaction: NONE

Cause: Frequencies have been detected on the DC link voltage that would suggest line asymmetry or failure of a line phase. It is also possible that a motor phase has failed.
Fault F30011 is output if the alarm is present and at the latest after 5 minutes.
The precise duration depends on the power unit type and the particular frequencies. For booksize and chassis power units, the duration also depends on how long the alarm has been active.
Alarm value (r2124, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: - check the line phase connection.
- check the motor feeder cable connections.
If there is no phase failure of the line or motor, then line asymmetry is involved.

IMMEDIATELY

Cause:

The power unit has detected an excessive rate of rise in the overvoltage range.

- closed-loop control is incorrectly parameterized.

- motor has a short-circuit or fault to ground (frame).

- U/f operation: Up ramp set too low.

- U/f operation: rated current of motor much greater than that of power unit.

- infeed: High discharge and post-charging currents for line voltage dip.

- infeed: High post-charging currents for overload when motoring and DC link voltage dip.

- infeed: Short-circuit currents at switch-on as there is no commutating reactor.

- power cables are not correctly connected.

- power cables exceed the maximum permissible length.

- power unit defective.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (switched off) due to a ground fault.

- the closed-loop circulating current control is either too slow or has been set too fast.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.

Bit 1: Phase V.

Bit 2: Phase W.

- Remedy:**

Error in the PROFIsafe control.

For these fault values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety message C01611.

Remedy:

For fault value = 1 ... 5 and 7 ... 999:

- check the cross data comparison that resulted in a STOP F.
- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 6:

- carry out a POWER ON (switch-off/switch-on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

For fault value = 1000:

- check the wiring of the safety-relevant inputs (SGE) on the Control Unit (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller.
- check the wiring of the failsafe inputs at the TM54F (contact problems).
- check the discrepancy time, and if required, increase the value (p9650/p9850).

For fault value = 1001, 1002:

A30666 (F)	SI Motion P2: Steady-state (static) 1 signal at the F-DI for safe acknowledgment		
Message value:	-		
Message class:	Error in the parameterization / configuration / commissioning procedure (18)		
Drive object:	VECTOR_G		
Component:	Power Module	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	A logical 1 signal is present at the F-DI configured in p10106 for more than 10 seconds. If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.		
Remedy:	Set the failsafe digital input (F-DI) to a logical 0 signal (p10106). Note: F-DI: Failsafe Digital Input

C30711	SI Motion P2: Defect in a monitoring channel		
Message value:	%1		
Message class:	Safety monitoring channel has identified an error (10)		
Drive object:	VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	IMMEDIATELY (POWER ON)		
Cause:	When cross-comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced. The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply: <ul style="list-style-type: none">- differently parameterized cycle times (p9500/p9300, p9511/p9311).- differently parameterized axis types (p9502/p9302).- excessively fast cycle times (p9500/p9300, p9511/p9311).- incorrect synchronization. Message value (r9749, interpret decimal): 0 ... 999: Number of the cross-compared data that resulted in this message. The significance of the individual message values is described in safety message C01711 of the Control Unit. 1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs. 1001: Initialization error of watchdog timer. 1002: User agreement after the timer has expired different. The user agreement is not consistent. After a time of 4 s has expired, the status of the user agreement is different in both monitoring channels.		

1003: Reference tolerance exceeded. When the user agreement is set, the difference between the new reference point that has been determined after power up (absolute encoder) or reference point approach (distance-coded or incremental measuring system) and the safe actual position (saved value + traversing distance) is greater than the reference tolerance (p9344). In this case, the user agreement is withdrawn.

1004:

Plausibility error for user agreement.

1. If the user agreement has already been set, then the setting is initiated again. In this case, the user agreement is withdrawn.

2. The user agreement was set, although the axis has still not been referenced.

1005:

- for safe motion monitoring functions without encoder: pulses already suppressed for test stop selection.

- for safe motion monitoring functions with encoder: STO already active for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the encoder actual value.

1014: fault when synchronizing the SGA for the "Safe cam" function

1015: Gearbox switchover (bit 27 in PROFIsafe telegram) takes longer than 2 min.

1020: Cyc. communication failure between the monit. channels.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder.

1024: Sign-of-life error for HTL/TTL encoders.

1030: Encoder fault detected from another monitoring channel.

1031:

- data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).

- the Sensor Module for the second channel was replaced.

- the encoder for the second channel has been incorrectly parameterized.

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

1045: CRC of the standstill position incorrect.

5000 ... 5140:

PROFIsafe message values.

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166:

PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

For these message values, the failsafe control signals (Failsafe Values) are transferred to the safety functions. If "STOP B after failure of the PROFIsafe communication" (p9812) is parameterized, the transfer of the Failsafe Values is delayed.

The significance of the individual message values is described in safety fault F01611 of the Control Unit.

7000: Difference of the safe position is greater than the parameterized tolerance (p9542/p9342).

7001: Scaling value for the safe position in the 16 bit notation, too low (p9574/p9374).

7002: Cycle counter for transferring the safe position is different in both monitoring channels.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion diagnostics STOP F)

Remedy:

For message value = 1002:

- perform safe acknowledgment, set the user agreement in both monitoring channels simultaneously (within 4 s).

For message value = 1003:

- check the mechanical system of the axis. It is possible that the axis was shifted when switched-off, and the last saved actual position no longer corresponds with the new actual position after the system has been powered up again.

- increase the tolerance for the actual value comparison when referencing (p9344).

Then check the actual values, perform a POWER ON and set the user agreement again.

For message value = 1004:

For 1., the following applies: Perform safe acknowledgment. Set the user agreement again.

For 2., the following applies: Perform safe acknowledgment. Only set the user agreement again if the axis has been referenced.

For message value = 1005:

- for safe motion monitoring functions without encoder: check the conditions for pulse enable.
- for safe motion monitoring functions with encoder: check the conditions for STO deselection.

Note:

For a Power Module, the test stop should always be performed when the pulses are enabled (independent of whether with encoder or without encoder).

For message value = 1012:

- upgrade the Sensor Module firmware to a more recent version.
- for 1-encoder systems, the following applies: check the encoder parameters for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
- for a 1-encoder system and 2-encoder system the following applies: in order to correctly copy the encoder parameters from p04xx, p9700 must be set to 46 and p9701 must be set to 172.
- for DQI encoders the following applies: If required, upgrade the firmware version of the Control Unit to a more recent version, which is released for DQI encoders.
- the parameterized encoder does not correspond to the connected encoder - replace the encoder.
- check the electrical cabinet design and cable routing for EMC compliance
- carry out a POWER ON (switch-off/switch-on) for all components or a warm restart (p0009 = 30, p0976 = 2, 3).
- replace the hardware.

For message value = 1014:

- check the encoder actual values. If required, increase the position tolerance (p9342) and/or the cam tolerance (p9340).

For message value = 1024:

- check the communication link.
- if required, increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (switch-off/switch-on) for all components.
- replace the hardware.

For message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

Adapt the encoder parameterization for the second channel as follows:

- set the encoder type (p0400).
- activate the safety commissioning mode (p0010 = 95).
- start the copy function for encoder parameters (p9700 = 46).
- exit the safety commissioning mode (p0010 = 0).
- save the parameters in a non-volatile fashion (copy RAM to ROM).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

For message value = 1040:

- deselect encoderless monitoring functions, select and deselect STO.
- if monitoring function "SLS" is active, issue a pulse enable within 5 s of deselecting STO.

For message value = 6000 ... 6999:

- the significance of the individual message values is described in safety fault F01611 of the Control Unit.

For other message values:

- the significance of the individual message values is described in safety message C01711.

Bit 0: Discrepancy error for F-DO 0 ...</p> <p>Note: If several discrepancy errors occur consecutively, then this message is only signaled for the first error that occurs.</p>
Remedy:	<p>- check the wiring of the F-DI (contact problems).</p> <p>Note: This message can be acknowledged via F-DI or PROFIsafe (safe acknowledgment). Discrepancy errors of an F-DI can only be acknowledged if safe acknowledgment was carried out once after the cause of the error was resolved (p10106, acknowledgment via PROFIsafe, extended message acknowledgment). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally. When the "Extended message acknowledgment" function (p9307.0) is active, the following applies: If the F-DI assigned for STO or SS1 is in a failsafe state due to a discrepancy error, then when deselecting via this F-DI, safe acknowledgment can no longer be executed. For cyclic switching operations at the F-DI, it may be necessary to adapt the discrepancy time to the switching frequency. If the period of a cyclic switching pulse corresponds to twice the value of p10102, then the following formulas should be checked: - $p10102 < (tp / 2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time) - $p10102 \geq p9300$ (discrepancy time must be at least p9300) - $p10102 > td$ (discrepancy time must be greater than the switch discrepancy time that may actually occur) td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI monitoring cycle (see p9300). tp = period for a switching operation in ms. When debounce p10017 is active, the discrepancy time is directly specified by the debounce time. If the period of a cyclic switching pulse corresponds to twice the debounce time, then the following formulas should be checked. - $p11002 < p10117 + 1 \text{ ms} - td$ - $p10102 > td$ - $p10102 \geq p9300$</p> <p>Example: For a 12 ms SI monitoring cycle and a switching frequency of 110 ms (p10117 = 0), the maximum discrepancy time which can be set is as follows: $p10102 \leq (110/2 \text{ ms}) - 12 \text{ ms} = 43 \text{ ms}$ Rounded-off, p10102 ≤ 36 ms is obtained (since the discrepancy time can only be accepted as a whole SI monitoring cycle, the value will need to be rounded up or down to a whole SI monitoring cycle if the result is not an exact multiple of an SI monitoring cycle).</p> <p>Note: F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output</p>

DI expected states in table format:

Test stop state: Expectation Mode 1 / Mode 2 / Mode 3 / Mode 4

5: -/1/1/-

7: -/0/0/-

9: -/0/1/-

11: -/0/1/-

13: -/1/1/-

Example:

Fault F01773 (P1) is signaled with fault value = 0001_0127 and fault F30773 (P2) is signaled with fault value 0000_0127.

This means that in state 7 (Z = 7) the state of the external readback signal was not set correctly (Y = 2) after DO-0 (X = 1) was switched to ON/ON.

Fault value 0001_0127 indicates that 0 was expected (W = 0) and 1 (V = 1) was read back from the hardware.

Fault value 0000_0127 on the processor 2 indicates that the states were as expected.

In the case of fault F30773, W and V are always identical; a value of 0 always means that 0 was expected at the readback input but was not present on processor 1.

Remedy:

Check the wiring of the failsafe digital output (F-DO) and restart the test stop.

Note:

- the fault is withdrawn if the test stop is successfully completed.

- in the event of multiple test stop faults, the first one that occurred is shown. Once the test stop has been restarted the next queued test stop fault will be signaled (if there is one).

A30788 Automatic test stop: wait for STO deselection via SMM

Message value:

-

Message class:

Safety monitoring channel has identified an error (10)

Drive object:

VECTOR_G

Component:

Motor

Propagation:

GLOBAL

Reaction:

NONE

Acknowledge:

NONE

Cause:

The automatic test stop was not able to be carried out after powering up.

Possible causes:

- the STO function is selected via Safety Extended Functions.

- a safety message is present, that resulted in a STO.

Note:

STO: Safe Torque Off

Remedy:

- Deselect STO via Safety Extended Functions.

- remove the cause of the safety messages and acknowledge the messages.

Note:

The automatic test stop is performed after removing the cause.

C30797 SI Motion P2: Axis not safely referenced

Message value: %1
Message class: Safety monitoring channel has identified an error (10)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The standstill position saved before switching off does not match the actual position determined at switch-on.
Message value (r9749, interpret decimal):
1: Axis not safely referenced.
2: User agreement missing.
Remedy: If safe automatic referencing is not possible the user must issue a user agreement for the new position using the softkey. This mean that this position is then designated as safety-relevant.
Note:
SI: Safety Integrated

C30798 SI Motion P2: Test stop for motion monitoring functions running

Message value: -
Message class: Safety monitoring channel has identified an error (10)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The forced checking procedure (test stop) for the safe motion monitoring functions is currently in progress.
Remedy: Not necessary.
The message is automatically withdrawn when the test stop has been completed.
Note:
SI: Safety Integrated

C30799 SI Motion P2: Acceptance test mode active

Message value: -
Message class: Safety monitoring channel has identified an error (10)
Drive object: VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The acceptance test mode is active.
This means the following:
- the setpoint velocity limiting is deactivated (r9733).
- the standard limit switches are deactivated during the acceptance test for function SLP (for EPOS internal, otherwise via r10234).
Remedy: Not necessary.
The message is automatically withdrawn when exiting the acceptance test mode.
Note:

F31100 (N, A)	Encoder 1: Zero mark distance error
Message value:	%1
Message class:	Actual position/speed value incorrect or not available (11)
Drive object:	B_INF, ENC, VECTOR_G
Component:	Encoder 1 Propagation: LOCAL
Reaction:	Vector: ENCODER (IASC/DCBRK, NONE, OFF1, OFF2, OFF3, STOP2) Infeed: NONE (OFF1, OFF2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections. - check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable.

Cause:	The zero mark signal level (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is undershot. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = 0, xxxx = Signal level, track R (16 bits with sign) The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32768 ... 32767 dec (-770 ... 770 mV).  When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected.

Limit value for the deviation:

- EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants).

- other encoders: 15 pulses = 60 quadrants.

Incremental encoder:

When the zero pulse is passed, a deviation in the incremental position was detected.

For equidistant zero marks, the following applies:

- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.

For distance-coded zero marks, the following applies:

- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.

Fault value (r0949, interpret decimal):

Deviation in quadrants (1 pulse = 4 quadrants).

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.
- check whether the coding disk is dirty or there are strong ambient magnetic fields.
- adapt the parameter for the clearance between zero marks (p0425).
- if message output above speed threshold, reduce filter time if necessary (p0438).

Message class:	Actual position/speed value incorrect or not available (11)		
Drive object:	B_INF, ENC, VECTOR_G		
Component:	Encoder 1	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance.
This alarm is triggered with active square-wave encoder PPR correction and re-parameterized fault 31131 if the accumulator contains larger values than p4683 or p4684.
The zero mark distance for zero mark monitoring is set in p0425 (rotary encoder).
Alarm value (r2124, interpret decimal):

See also: p0491 (Motor encoder fault response ENCODER)
Remedy:
- check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- check the encoder type (encoder with equidistant zero marks).
- adapt the parameter for the distance between zero marks (p0424, p0425).

Message value: %1
Message class: Actual position/speed value incorrect or not available (11)
Drive object: B_INF, ENC, VECTOR_G
Component: Encoder 1 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The error for track C/D is greater than +/-15 ° mechanical or +/-60 ° electrical or the error for the Hall signals is greater than +/-60 ° electrical.
One period of track C/D corresponds to 360 ° mechanical.
One period of the Hall signal corresponds to 360 ° electrical.
The monitoring responds if, for example, Hall sensors are connected as equivalent for the C/D tracks with the incorrect rotational sense or supply values that are not accurate enough.
Alarm value (r2124, interpret decimal):
For track C/D, the following applies:
Measured deviation as mechanical angle (16 bits with sign, 182 dec corresponds to 1 °).
For Hall signals, the following applies:
Measured deviation as electrical angle (16 bits with sign, 182 dec corresponds to 1 °).
See also: p0491 (Motor encoder fault response ENCODER)
Remedy:
- track C or D not connected.
- correct the direction of rotation of the Hall sensor possibly connected as equivalent for track C/D.
- check that the encoder cables are routed in compliance with EMC.
- check the adjustment of the Hall sensor.

Message value: %1
Message class: Actual position/speed value incorrect or not available (11)
Drive object: B_INF, ENC, VECTOR_G
Component: Encoder 1 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: When the zero pulse is passed, a deviation in the incremental position was detected.
For equidistant zero marks, the following applies:
- the first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark.
For distance-coded zero marks, the following applies:
- the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair.
Alarm value (r2124, interpret decimal):
Deviation in quadrants (1 pulse = 4 quadrants).
See also: p0491 (Motor encoder fault response ENCODER)
Remedy: - check that the encoder cables are routed in compliance with EMC.
- check the plug connections.
- replace the encoder or encoder cable.

Reaction:	Vector: OFF1 (NONE, OFF2, OFF3) Infeed: OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

A31811 (F, N) Encoder 1: Encoder serial number changed

Message value: -
Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: B_INF, ENC, VECTOR_G
Component: Encoder 1 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2).
 Cause 1:
 - the encoder was replaced.
 Cause 2:
 - a third-party, built-in or linear motor was re-commissioned.
 Cause 3:
 - the motor with integrated and adjusted encoder was replaced.

4 Faults and alarms

4.2 List of faults and alarms

Cause 4:

- the firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2118, p2119).

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

For causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

SERVO:

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

For causes 3, 4:

Accept the new serial number with p0440 = 1.

Cause: The selected device combination is not supported.
 Fault value (r0949, interpret decimal):
 1003:
 The connected measuring unit cannot be operated with the EnDat 2.2 converter. For instance, the measuring unit has a pulse number/resolution of 2^n .
 1005:
 The type of measuring unit (incremental) is not supported by the EnDat 2.2 converter.
 1006:
 The maximum duration of the EnDat transfer (31.25 μ s) was exceeded.
 2001:
 The set combination of current controller cycle, DP cycle and Safety cycle is not supported by the EnDat 2.2 converter.
 2002:
 The resolution of the linear measuring unit does not match the pole pair width of the linear motor
 Pole pair width, minimum = $p0422 * 2^{20}$
Remedy: For fault value = 1003, 1005, 1006:
 - Use a measuring unit that is permissible.
 For fault value = 2001:
 - set a permissible cycle combination (if required, use standard settings).
 For fault value = 2002:
 - Use a measuring unit with a lower resolution (p0422).

Drive object:	VECTOR_G
Component:	Encoder 2 Propagation: LOCAL
Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3)
Acknowledge:	PULSE INHIBIT
Cause:	An encoder power supply fault was detected. Fault value (r0949, interpret binary): Bit 0: Undervoltage condition on the sense line. Bit 1: Overcurrent condition for the encoder power supply. Bit 2: Overcurrent condition for encoder power supply on cable resolver excitation negative. Bit 3: Overcurrent condition for encoder power supply on cable resolver excitation positive. Bit 4: The 24 V power supply through the Power Module (PM) is overloaded. Bit 5: Overcurrent at the EnDat connection of the converter. Bit 6: Overvoltage at the EnDat connection of the converter. Bit 7: Hardware fault at the EnDat connection of the converter. Note: If the encoder cables 6FX2002-2EQ00-.... and 6FX2002-2CH00-.... are interchanged, this can result in the encoder being destroyed because the pins of the operating voltage are reversed.
Remedy:	For fault value, bit 0 = 1: - correct encoder cable connected? - check the plug connections of the encoder cable. - SMC30: Check the parameterization (p0404.22). For fault value, bit 1 = 1: - correct encoder cable connected? - replace the encoder or encoder cable. For fault value, bit 2 = 1: - correct encoder cable connected? - replace the encoder or encoder cable. The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is > 750 mV.

A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms).

The response threshold is > 3582 mV.

A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Remedy:

Reaction: OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Acknowledge: PULSE INHIBIT

Cause:

After initializing the pole position using track C/D, Hall signals or pole position identification routine, the zero mark was detected outside the permissible range. For distance-coded encoders, the test is carried out after passing 2 zero marks. Fine synchronization was not carried out.

When initializing via track C/D (p0404) then it is checked whether the zero mark occurs in an angular range of +/-18 ° mechanical.

When initializing via Hall sensors (p0404) or pole position identification (p1982) it is checked whether the zero mark occurs in an angular range of +/-60 ° electrical.

- check the plug connections.
- if the Hall sensor is used as an equivalent for track C/D, check the connection.
- check the connection of track C or D.
- replace the encoder or encoder cable.

Alarm value (r2124, interpret hexadecimal):

yyyyxxxx hex:

yyyy = Angle

xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV $-25/+20\%$).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Component: Encoder 2 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: Channel A and B are not activated for the analog sensor.
Remedy:
- activate channel A and/or channel B (p4670).
- check the encoder configuration (p0404.17).

Message value: %1
Message class: Actual position/speed value incorrect or not available (11)
Drive object: VECTOR_G
Component: Encoder 2 **Propagation:** LOCAL
Reaction: NONE
Acknowledge: NONE
Cause: The position value has exceeded the permissible range of -0.5 ... +0.5.
Alarm value (r2124, interpret decimal):
1: Position value from the LVDT sensor.
2: Position value from the encoder characteristic.
Remedy:
For alarm value = 1:
- check the LVDT ratio (p4678).
- check the reference signal connection at track B.
For alarm value = 2:
- check the coefficients of the characteristic (p4663 ... p4666).

F32500 (N, A) Encoder 2: Position tracking traversing range exceeded

Message value: -

Message class: Actual position/speed value incorrect or not available (11)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

Remedy: The fault should be resolved as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and the absolute encoder adjusted.

F32501 (N, A) Encoder 2: Position tracking encoder position outside tolerance window

Message value: %1

Message class: Actual position/speed value incorrect or not available (11)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)

Remedy: Reset the position tracking as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010

A32811 (F, N) Encoder 2: Encoder serial number changed

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: Encoder 2

Propagation: LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).

- the encoder was replaced.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

Remedy: Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Drive object:	VECTOR_G
Component:	Encoder 3
Propagation:	LOCAL
Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)

Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Acknowledge:	PULSE INHIBIT
Cause:	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. yyyy = Angle

xxxx = amplitude, i.e. root of $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV $-25/+20$ %).

The response threshold is < 230 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is present at the negative zero crossover of track B.

Note for Sensor Modules for resolvers (e.g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

F33500 (N, A) Encoder 3: Position tracking traversing range exceeded

Message value: -

Message class: Actual position/speed value incorrect or not available (11)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

Remedy: The fault should be resolved as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and the absolute encoder adjusted.

Message value: %1

Message class: Actual position/speed value incorrect or not available (11)

Drive object: VECTOR_G

Component: None **Propagation:** GLOBAL

Reaction: OFF1 (NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: When switched off, the drive/encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value. The sign designates the traversing direction.
 Note: The deviation (difference) found is also displayed in r0477. See also: p0413 (Measuring gear position tracking tolerance window), r0477 (Measuring gear position difference)

Remedy: Reset the position tracking as follows:
 - select encoder commissioning (p0010 = 4).
 - reset the position tracking as follows (p0411.2 = 1).
 - deselect encoder commissioning (p0010 = 0).
 The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010

A33811 (F, N) Encoder 3: Encoder serial number changed

Message value: -

Message class: Error in the parameterization / configuration / commissioning procedure (18)

Drive object: VECTOR_G

Component: Encoder 3

Propagation: LOCAL

Reaction: NONE

Acknowledge: NONE

Cause: The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).

- the encoder was replaced.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).

When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

Remedy: Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Cause:	The properties of the DRIVE-CLiQ component (Sensor Module for encoder 3), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
Remedy:	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

Drive object:	VECTOR_G
Component:	Sensor Module Encoder 3
Propagation:	LOCAL
Reaction:	OFF1 (IASC/DCBRK, NONE, OFF2, OFF3, STOP2)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	A fault occurred on the Sensor Module for encoder 3 that cannot be interpreted by the Control Unit firmware. This can occur if the firmware on this component is more recent than the firmware on the Control Unit. Fault value (r0949, interpret decimal): Fault number. Note: If required, the significance of this new fault can be read about in a more recent description of the Control Unit.

Fault value (r0949, interpret decimal):

yyyyxxxx dec: yyyy = supplementary information, xxxx = parameter

xxxx = 421:

For an EnDat/SSI encoder, the absolute position in the protocol must be less than or equal to 30 bits.

yyyy = 0:

No additional information available.

yyyy = 1:

The component does not support HTL level (p0405.1 = 0) combined with track monitoring A/B <> -A/B (p0405.2 = 1).

yyyy = 2:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please start a new encoder identification.

yyyy = 3:

A code number for an identified encoder has been entered into p0400, however, no identification was carried out. Please select a listed encoder in p0400 with a code number < 10000.

yyyy = 4:

This component does not support SSI encoders (p0404.9 = 1) without track A/B.

yyyy = 5:

For SQW encoder, value in p4686 greater than in p0425.

yyyy = 6:

DRIVE-CLiQ encoder cannot be used with this firmware version.

yyyy = 7:

For an SQW encoder, the XIST1 correction (p0437.2) is only permitted for equidistant zero marks.

yyyy = 8:

The motor pole pair width is not supported by the linear scale being used.

yyyy = 9:

The length of the position in the EnDat protocol may be a maximum of 32 bits.

yyyy = 10:

The connected encoder is not supported.

yyyy = 11:

The hardware does not support track monitoring.

Remedy:

- check whether the connected encoder type matches the encoder that has been parameterized.
- correct the parameter specified by the fault value (r0949) and p0187.
- re parameter number = 314:
- check the pole pair number and measuring gear ratio. The quotient of the "pole pair number" divided by the "measuring gear ratio" must be less than or equal to 1000 ((r0313 * p0433) / p0432 <= 1000).

Message class: Error in the parameterization / configuration / commissioning procedure (18)
Drive object: B_INF, TM54F_MA, TM54F_SL, VECTOR_G
Component: None **Propagation:** GLOBAL
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The functionality of Safety Basic Functions via TM54F is used.
TM54F has been incorrectly parameterized (incorrect parameter assignment).
Only the following signals may be parameterized:
- STO active
- SS1 active
- internal event
- safe state
Possible causes:
- p10024 ... p10038 not set to 0 or 255.
- p10039, p10042 ... p10045 use signals from Safety Extended Functions.
Fault value (r0949, interpret binary):
Bits 0 ... 3 specifies for which drive group an illegal F-DI was parameterized:
Bit 0 = 1: drive group 1 error
Bit 1 = 1: drive group 2 error
Bit 2 = 1: drive group 3 error
Bit 3 = 1: drive group 4 error
Bits 4 ... 7 specifies for which F-DOs incorrect links were specified:
Bit 4 = 1: F-DO 0 error (p10042)
Bit 5 = 1: F-DO 1 error (p10043)
Bit 6 = 1: F-DO 2 error (p10044)
Bit 7 = 1: F-DO 3 error (p10045)
Remedy: - check the setting of the failsafe digital inputs (F-DI) for the Safety Extended Functions - and set to a value of 0 or 255 (p10024 ... p10039).
- check the setting of the signal sources for the failsafe digital outputs (F-DO) and if necessary, correct (p10042 ... p10045).

Remedy:	- acknowledge all faults on the Control Unit (BI: p2102). or - acknowledge all faults on the drive object TM54F (BI: p2103, p2104 or p2105). Note: A fault acknowledgment is triggered with a 0/1 signal.

Drive object:	B_INF, TM54F_MA, TM54F_SL, VECTOR_G
Component:	Terminal Module (TM) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	- the communication cycle specified in p10000[x] does not correspond with the monitoring cycle of the drive object, which was specified in p10010[x]. As long as this fault is present, Failsafe Values are activated in TM54F. All the drives are not enabled. Fault value (r0949, interpret binary): If a bit is set in the range bit 0 ... 5, then the following applies: The communication cycle specified in p10000[x] does not correspond with the monitoring cycle of the drive object which was specified in p10010[x]. (if only p10000[0] used, then this value must be identical with all monitoring cycles of the drive objects used in p10010[0...5].) Bit 0 = 1: p10000[0] does not correspond with the monitoring cycle of p10010[0] Bit 1 = 1: p10000[1] does not correspond with the monitoring cycle of p10010[1] ... Bit 5 = 1: p10000[5] does not correspond with the monitoring cycle of p10010[5] If a bit is set in the range bit 16 ... 21, then the following applies: Bit 16 = 1: p10000[0] has been selected too low. Bit 17 = 1: p10000[1] has been selected too low. ... Bit 21 = 1: p10000[5] has been selected too low. When using an axis with Basic Safety Functions with TM54F, then the monitoring cycle should be greater than 500us + 8 * current controller clock cycles of the drive. Note: This error is also signaled if a drive controlled with TM54F is parameterized so that the basic functions are controlled via TM54F - and simultaneously the extended safety functions or ncSI have been parameterized. The following applies for fault value = 0: - since the firmware update of the TM54F it has not been switched off. - the firmware of the connected TM54F is too old. See also: p10010 (SI TM54F drive object assignment)
Remedy:	For a fault value in the range from bit 0 ... 5: - first check that all drives, which are entered in p10010, have either Extended Safety Functions or Basic Functions via TM54F. - Execute the copy function for TM54F(p9700 = 87). - adapt the checksums for TM54F(p9701 = 172). - copy RAM to ROM. - carry out a POWER ON.

The expected states to be checked depend on the parameterized test mode (p10047).

The following expected states are tested in the test steps when testing the F-DOs:

The display format is as follows:

Test step (SL MA): Expected Diag-DO mode 1 | Expected DI 20 ... 23 mode 2 | Expected DI 20 ... 23 mode 3

(4C hex 57 hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

(62 hex 6D hex): Diag-DO = 0 V | DI = 0 V | DI = 0 V

(78 hex 83 hex): Diag-DO = 0 V | DI = 0 V | DI = 24 V

(8E hex 99 hex): Diag-DO = 24 V | DI = 0 V | DI = 24 V

(A4 hex AF hex): Diag-DO = 0 V | DI = 24 V | DI = 24 V

Example:

If an error with fault causes bb = 02 hex or 04 hex occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.

Master signals fault value 0001_04AF and slave signals fault value 0001_04A4.

aaaa = 1 --> F-DO 0 is involved.

bb = 04 hex --> the test of the Diag-DO was unsuccessful.

cc = The expected states were tested in test stop step AF on the master and A4 on the slave.

The expected state Diag-DO = 0 V was checked in the table, i.e. Diag-DO was at 0 V instead of the expected 24 V.

The associated test action took place in the previous step (99 hex DO OFF, A4 hex DO OFF). Both DOs were switched to OFF.

Remedy:

Check the wiring of the F-DIs and F-DOs and restart the test stop.

Note:

The fault is withdrawn if the test stop is successfully completed.

For fault value = CCCCCCCC hex, DDDDDDDD hex, EEEEEEEE hex the following applies:

These fault values occur together with fault F35152.

Possible countermeasure:

- check all parameters for the test stop.
- you should also check whether the firmware version of the TM54F matches that of the Control Unit.
- check p10001, p10017, p10046 and p10047.

A POWER ON must be carried out after correcting the parameters.

Cause:	The time set in p10003 for the forced checking procedure (test stop) for the digital inputs/outputs has been exceeded. A new forced checking procedure is required. After the next time the forced checking procedure is selected, the message is withdrawn and the monitoring time is reset. Note: - this message does not result in a safety stop response. - the test must be performed within a defined, maximum time interval (p10003, maximum of 8760 hours) in order to comply with the requirements as laid down in the standards for timely fault detection and the conditions to calculate the failure rates of safety functions (PFH value). Operation beyond this maximum time period is permissible if it can be ensured that the forced checking procedure is performed before persons enter the hazardous area and who are depending on the safety functions correctly functioning. See also: p10003 (SI TM54F forced checking procedure timer)
Remedy:	Carry out the forced checking procedure for the digital inputs/outputs. The signal source to select the forced checking procedure is set via binector input p10007. See also: p10007 (SI TM54F forced checking procedure F-DI/F-DO signal source)

A35015	TM54F: Motor/Hydraulic Module replaced or configuration inconsistent
Message value:	Fault cause: %1 bin
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	B_INF, TM54F_MA, TM54F_SL, VECTOR_G
Component:	None Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	NONE
Cause:	Cyclic communication of at least one drive with the Terminal Module 54F (TM54F) is not active. Possible causes: - at least one Motor Module/Hydraulic Module was replaced (e.g. hardware was replaced). - the parameterization of the TM54F (p10010) is inconsistent with the number of drives, which have drive-based motion monitoring functions activated with TM54F. - for the signaled drive, it is not permissible that the "Safe motion monitoring without selection" (p9601.5 = 1) is parameterized. - And activated drive has no communication via DRIVE-CLiQ. - p10010 of the TM54F master module is not the same as p10010 of the TM54F slave module (in this case, F35051 is also output). - in p10010 of the TM54F master or slave module, the number of a drive object was entered several times. - the control of the Basis Functions via TM54F was parameterized, and simultaneously the Extended Safety Functions or ncSI were parameterized. Alarm value (r2124, interpret binary): yyyy yyyy xxxx xxxx bin xxxx xxxx bin: inconsistent configuration Bit 0 = 1: No communication with drive 1. ... Bit 5 = 1: No communication with drive 6. yyyy yyyy bin: Motor Module/Hydraulic Module replaced or a DRIVE-CLiQ cable of a Motor Module/Hydraulic Module not inserted. Bit 8 = 1: Motor Module/Hydraulic Module from drive 1 was replaced or does not communicate. ... Bit 13 = 1: Motor Module/Hydraulic Module from drive 6 was replaced or does not communicate. Note: When this alarm is active, none of the drives listed in the alarm value, which have drive-based motion monitoring functions operating with TM54F, are enabled.

For alarm value = 0:

The number of drive objects specified in p10010 is not equal to the number of drives that have drive-based motion monitoring functions that have been enabled.

See also: p10010 (SI TM54F drive object assignment)

Remedy:

For all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).

Check as to whether F35051 is also output and remove the cause.

Check whether each drive object number is listed only once in the indices of p10010.

Note:

If a drive was deactivated and activated without first having established the DRIVE-CLiQ connection, then this alarm is also output.

When replacing a Motor Module/Hydraulic Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

For SINUMERIK, the following applies:

HMI supports the replacement of components with Safety functions (operating area "Diagnostics" --> Softkey "Alarm list" --> Softkey "Confirm SI HW" etc.).

The precise procedure is given in the following document:

A35016**TM54F: Net data communication with drive not established**

Message value: -

Message class: Internal (DRIVE-CLiQ) communication error (12)

Drive object: B_INF, TM54F_MA, TM54F_SL, VECTOR_G

Component: None

Propagation: GLOBAL

Reaction: NONE

Acknowledge: NONE

Cause: The cyclic net data communication within the Terminal Module 54F (TM54F) is still not active for at least one drive.

Note:

This message is output after the TM54F master and TM54F slave have booted and is automatically withdrawn as soon as communications have been established.

Remedy:

When replacing a Motor Module/Hydraulic Module, carry out the following steps:

- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (switch-off/switch-on) for all components.

The following always applies:

- for all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).
- check whether fault F35150 is present and if required, remove the cause of this fault.

Note:

The communication status of the individual drives is indicated in r10055. The corresponding drive objects can be identified together with p10010.

Drive object: B_INF, TM54F_MA, TM54F_SL, VECTOR_G

Component: Terminal Module (TM) **Propagation:** GLOBAL

Cause: A logical 1 signal is present at the F-DI configured in p10006 for more than 10 seconds.

If, at the F-DI no acknowledgment was performed for safe acknowledgment, then a steady-state logical and 0 signal must be present. This avoids unintentional safety-relevant acknowledgment (or the "Internal Event Acknowledge" signal) if a wire breaks or one of the two digital inputs bounces.

F35151	TM54F: Discrepancy error
Message value:	%1
Message class:	Error in the parameterization / configuration / commissioning procedure (18)
Drive object:	B_INF, TM54F_MA, TM54F_SL, VECTOR_G
Component:	Terminal Module (TM) Propagation: GLOBAL
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The safe input terminals or output terminals have a different state for longer than the time parameterized in p10002 - or too many switching operations were carried out within a monitoring cycle p10002. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex xxxx: The safety-relevant input terminals F-DI indicate a discrepancy. Bit 0: Discrepancy for F-DI 0 ... Bit 9: Discrepancy for F-DI 9 yyyy: The safety-relevant output terminals F-DO indicate a discrepancy. Bit 0: Discrepancy for F-DO 0 ... Bit 3: Discrepancy for F-DO 3 Note: If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs. The following options are available to analyze all of the discrepancy errors: - using the commissioning tool, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here. - compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.
Remedy:	Check the wiring of the corresponding F-DI (contact problems). If the wiring is correct, and for example there is no wire breakage, then a check must be made as to whether the switching frequency at F-DI is too high and must therefore be reduced (switching pulses must have a longer time between them). The time interval between each signal edge at an F-DI must be at least equal to the discrepancy time before the input is switched again. Discrepancy errors in the failsafe digital inputs (F-DI) can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgment was carried out (see p10006). As long as safety acknowledgment was not carried out, the corresponding F-DI stays in the safe state internally.

Sets the discrepancy time for fast switching operations at the F-DIs:

For fast switching operations at the failsafe digital inputs (F-DI), it may be necessary to adapt the discrepancy time to the switching frequency:

- the period of a cyclic switching pulse must be less than half of the discrepancy time (if necessary, round down).
- the time between two switching pulses should be longer than the discrepancy time (if necessary, round up).
- the discrepancy time must be at least r10003 (it must always be rounded-down or rounded-up to an integer multiple of the SI sampling time r10003). If a debounce time has been parameterized (p10017 > 0), then the shortest possible discrepancy time is directly specified using the debounce time.
- the period of a cyclic switching pulse must be less than half of the discrepancy time p10017 (if necessary, round down).
- the time between two fast switching pulses should be longer than the discrepancy time+p10017 (if necessary, round up).
- the discrepancy time must be at least r10003.

The debounce time must always be set less than the discrepancy time.

Example:

If the SI sampling cycle is 12 ms and the switching frequency is 110 ms (p10017 = 0), the maximum discrepancy time which can be set is as follows:

$p10002 \leq 110/2 \text{ ms} - 12 \text{ ms} = 43 \text{ ms}$ --> rounded-off, the following is obtained $p10002 \leq 36 \text{ ms}$

Since the discrepancy time can only be accepted as a whole SI sampling time, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact integer multiple of an SI sampling time.

Basic secondary condition to set the discrepancy time:

The discrepancy time of the F-DIs must always be longer than the longest SI sampling time of all drives that use Safety Integrated with TM54F (p9780/p9500).

Component:	Terminal Module (TM) Propagation: BICO
Reaction:	Vector: OFF1 (NONE, OFF2, OFF3) Infeed: OFF1 (NONE, OFF2)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The signals output from the Terminal Module 41 (TM41) for tracks A/B have reached the limit frequency. The output signals are no longer in synchronism with the specified setpoint. SIMOTION (p4400 = 0) operating mode: - if the TM41 has been configured as the technology project, this fault is also output in response to short-circuited A/B signals in X520. SINAMICS (p4400 = 1) operating mode: - the fine resolution of TM41 in p0418 does not match that of the connector input that was interconnected at p4420 - the encoder position actual value r0479 interconnected at connector input p4420 has an excessively high actual speed - the output signals correspond to a speed, which is greater than the maximum speed (r1082 of TM41).
Remedy:	SIMOTION (p4400 = 0) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). - check track A/B for short-circuits. SINAMICS (p4400 = 1) operating mode: - enter a lower speed setpoint (p1155). - reduce the encoder pulse number (p0408). Drive object: B_INF, TM120, TM150, TM31, VECTOR_G
Component: Terminal Module (TM) **Propagation:** BICO
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A function requested by the Control Unit is not supported by a DRIVE-CLiQ component.
Fault value (r0949, interpret decimal):
1: Terminal Module 31 does not support the function "Timer for temperature evaluation" (X522.7/8, p4103 > 0.000).
4: The improved actual value resolution is not supported (p4401.4).
5: The improved setpoint resolution is not supported (p4401.5).
6: The residual value handling in the setpoint channel cannot be deactivated (p4401.6).
7: Output frequencies greater than 750 kHz cannot be activated (p4401.7).
Remedy: For fault value = 1:
- Deactivate timer for temperature evaluation (X522.7/8) (p4103 = 0.000).
- use Terminal Module 31 and the relevant firmware version to enable the "Timer for temperature evaluation" function (Article No. 6SL3055-0AA00-3AA1, firmware version 2.6 and higher).

Cause:	For the temperature evaluation via the Terminal Module 150 (TM150), at least one of the following conditions to initiate this fault is fulfilled: - alarm threshold has been exceeded longer than that set in the timer (p4102[22], p4103[11]). or - fault threshold exceeded (p4102[23]). Note: For sensor type "PTC thermistor" and "Bimetallic NC contact" (p4100[11] = 1, 4), the following applies: - if r4101[11] > 1650 ohms, the temperature r4105[11] = 250 °C - if r4101[11] <= 1650 ohms, the temperature r4105[11] = -50 °C The temperature actual value is displayed via connector output r4105[11] and can be interconnected. Notice: This fault only causes the drive to shut down if there is at least one BICO interconnection between the drive and the Terminal Module. Fault value (r0949, interpret decimal): Temperature actual value at the time of initiation [0.1 °C].
Remedy:	- allow the temperature sensor to cool down to below p4102[23] - hysteresis (p4118[11]). - if required, set the fault response to NONE (p2100, p2101). See also: p4102

Cause:	The maximum permissible number of errors in the master sign-of-life (clock synchronous operation) has been exceeded in cyclic operation. When the alarm is output, the module outputs are reset up to the next synchronization.
Remedy:	- check the physical bus configuration (terminating resistor, shielding, etc.). - check the interconnection of the master sign-of-life (r4201 via p0915). - check whether the master correctly sends the sign-of-life (e.g. set up a trace with r4201.12 ... r4201.15 and trigger signal r4301.9). - check the bus and master for utilization level (e.g. bus cycle time Tdp was set too short).

The type of the receive telegram does not match the receive list.

6 (= 06 hex):

The address of the power unit in the telegram and in the receive list do not match.

9 (= 09 hex):

The DRIVE-CLiQ communication from the DRIVE-CLiQ component involved to the Control Unit signals that the supply voltage has failed.

16 (= 10 hex):

The receive telegram is too early.

17 (= 11 hex):

CRC error and the receive telegram is too early.

18 (= 12 hex):

The telegram is shorter than that specified in the length byte or in the receive list and the receive telegram is too early.

19 (= 13 hex):

The telegram is longer than that specified in the length byte or in the receive list and the receive telegram is too early.

20 (= 14 hex):
The length of the receive telegram does not match the receive list and the receive telegram is too early.

21 (= 15 hex):
The type of the receive telegram does not match the receive list and the receive telegram is too early.

22 (= 16 hex):
The address of the power unit in the telegram and in the receive list does not match and the receive telegram is too early.

25 (= 19 hex):
The error bit in the receive telegram is set and the receive telegram is too early.

Note regarding the message value:
The individual information is coded as follows in the message value (r0949/r2124):
0000yyxx hex: yy = component number, xx = error cause

Remedy:

- carry out a POWER ON (switch-off/switch-on).
- check the electrical cabinet design and cable routing for EMC compliance
- check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...).

Fault cause: 32 (= 20 hex): Error in the telegram header. 35 (= 23 hex): Receive error: The telegram buffer memory contains an error. 66 (= 42 hex): Send error: The telegram buffer memory contains an error. 67 (= 43 hex): Send error: The telegram buffer memory contains an error. 96 (= 60 hex): Response received too late during runtime measurement. 97 (= 61 hex): Time taken to exchange characteristic data too long. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause
Remedy:	<ul style="list-style-type: none"> - check the DRIVE-CLiQ wiring (interrupted cable, contacts, ...). - check the electrical cabinet design and cable routing for EMC compliance - if required, use another DRIVE-CLiQ socket (p9904). - replace the component involved.

4 Faults and alarms

4.2 List of faults and alarms

F40895	CX32 DRIVE-CLiQ (CU): Cyclic data transfer error		
Message value:	Component number: %1, fault cause: %2		
Message class:	Internal (DRIVE-CLiQ) communication error (12)		
Drive object:	All objects		
Component:	DRIVE-CLiQ Hub Module (Hub)	Propagation:	LOCAL
Reaction:	OFF2		
Acknowledge:	IMMEDIATELY		
Cause:	A DRIVE-CLiQ communications error has occurred from the controller extension involved to the Control Unit. Fault cause: 11 (= 0B hex): Synchronization error during alternating cyclic data transfer. Note regarding the message value: The individual information is coded as follows in the message value (r0949/r2124): 0000yyxx hex: yy = component number, xx = error cause		
Remedy:	Carry out a POWER ON (switch-off/switch-on).		
<hr/>			
F49150	Cooling unit: Fault occurred		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF2		
Acknowledge:	IMMEDIATELY		
Cause:	The cooling unit signals a general fault.		
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit. See also: p0266 (Cooling unit feedback signals signal source)		
<hr/>			
F49151	Cooling unit: Conductivity has exceeded the fault threshold		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF2		
Acknowledge:	IMMEDIATELY		
Cause:	The conductivity of the cooling liquid has exceeded the selected fault threshold (p0269[2]). See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source)		
Remedy:	Check the device to de-ionize the cooling liquid.		
<hr/>			
F49152	Cooling unit: ON command feedback signal missing		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	OFF2		
Acknowledge:	IMMEDIATELY		
Cause:	The feedback signal of the ON command of the cooling unit is missing. - after the ON command, the feedback signal has not been received within the selected starting time (p0260). - the feedback signal has failed in operation. - the cooling system was stopped by an external signal. See also: p0260 (Cooling unit starting time 1), r0267 (Cooling unit status word)		
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the wiring between the output terminal (Terminal Module) and the cooling system. - check the external control device for the cooling unit.		

F49153	Cooling unit: Liquid flow too low
Message value:	-
Message class:	Auxiliary unit faulted (20)
Drive object:	B_INF, VECTOR_G
Component:	None
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The drive converter cooling unit signals that the cooling liquid flow is too low. - after the ON command, the feedback signal has not been received within the selected starting time (p0260). - in operation, the feedback signal has failed for longer than the permitted failure time (p0263). See also: p0260 (Cooling unit starting time 1), p0263 (Cooling unit fault liquid flow delay time), r0267 (Cooling unit status word)
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit.
F49154 (A)	Cooling unit: Liquid leak is present
Message value:	-
Message class:	Auxiliary unit faulted (20)
Drive object:	B_INF, VECTOR_G
Component:	None
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The liquid leakage monitoring function has responded. Caution: If this fault is reparameterized as an alarm, then using other monitoring functions it must be ensured that when cooling water is lost, the drive is switched off! See also: r0267 (Cooling unit status word)
Remedy:	- check the cooling system for leaks in the cooling circuit. - check the wiring of the input terminal (Terminal Module) used to monitor leaking fluid.
Reaction upon A:	NONE
Acknowl. upon A:	NONE
F49155	Cooling unit: Power Stack Adapter, firmware version too old
Message value:	-
Message class:	Auxiliary unit faulted (20)
Drive object:	B_INF, VECTOR_G
Component:	None
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.
Remedy:	Upgrade the firmware. Check EEPROM data.
F49156	Cooling unit: Cooling liquid temperature has exceeded the fault threshold
Message value:	-
Message class:	Auxiliary unit faulted (20)
Drive object:	B_INF, VECTOR_G
Component:	None
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The cooling liquid intake temperature has exceeded the specified fault threshold. Note: The value for the fault threshold depends on the power unit (hardware description data, e.g. 52 ... 55 °C).
Remedy:	Check the cooling system and the ambient conditions.

4 Faults and alarms

4.2 List of faults and alarms

A49170	Cooling unit: Alarm has occurred		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The cooling unit signals a general alarm.		
Remedy:	- check the wiring between the cooling unit and the input terminal (Terminal Module). - check the external control device for the cooling unit.		

A49171 (N)	Cooling unit: Conductivity has exceeded the alarm threshold		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	Conductivity monitoring is set for the cooling liquid (r0267.7, from p0266[7]). See also: p0261 (Cooling unit starting time 2), p0262 (Cooling unit fault conductivity delay time), p0266 (Cooling unit feedback signals signal source), r0267 (Cooling unit status word)		
Remedy:	Check the device to de-ionize the cooling liquid.		
Reaction upon N:	NONE		
Acknowl. upon N:	NONE		

A49171 (N)	Cooling unit: Conductivity has exceeded the alarm threshold		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The conductivity of the cooling liquid has exceeded the selected alarm threshold (p0269[1]). Note: The threshold cannot be set higher than the fault threshold specified in the equipment description.		
Remedy:	Check the device to de-ionize the cooling liquid.		
Reaction upon N:	NONE		
Acknowl. upon N:	NONE		

A49172	Cooling unit: Conductivity actual value is not valid		
Message value:	-		
Message class:	Auxiliary unit faulted (20)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.		
Remedy:	- check the wiring between the cooling unit and the Power Stack Adapter (PSA). - check the function of the sensor to measure the conductivity.		

4 Faults and alarms

4.2 List of faults and alarms

A49204 (N)	Excitation switch-off alarm		
Message value:	-		
Message class:	Hardware/software error (1)		
Drive object:	VECTOR_G		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	When switching off the excitation, after the delay time (p1647) has expired, the excitation current has still not decayed to zero.		
Remedy:	Extend the switch-off delay time in (p1647). Note: The alarm is automatically withdrawn after adapting p1647. See also: p1647 (Excitation switch-off delay time)		
Reaction upon N:	NONE		
Acknowl. upon N:	NONE		

A49205	Excitation: incorrect parameterization of the brushless exciter		
Message value:	Parameter: %1		
Message class:	General drive fault (19)		
Drive object:	VECTOR_G		
Component:	Control Unit (CU)	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	The brushless exciter has not been completely parameterized. The speed-dependent ratio cannot be calculated. As a consequence, it is assumed to be 1. Alarm value (r2124, interpret decimal): Parameter number that is assigned an illegal value. See also: p0699 (Excitation configuration)		
Remedy:	Set a value <> 0 for the parameter that is displayed. See also: p0690, p0691, p0692, p0693, p0694, p0696, p0697, p0698		

A49998	Recorder trigger event occurred		
Message value:	%1		
Message class:	Hardware/software error (1)		
Drive object:	B_INF, VECTOR_G		
Component:	None	Propagation:	GLOBAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	A recorder trigger event has occurred. The data are then written to the memory card, specifying the event number. Alarm value (r2124, interpret decimal): Event number.		
Remedy:	Not necessary. This message disappears automatically.		

A50002 (F)	COMM BOARD: Alarm 2		
Message value:	%1		
Message class:	Communication error to the higher-level control system (9)		
Drive object:	All objects		
Component:	None	Propagation:	LOCAL
Reaction:	NONE		
Acknowledge:	NONE		
Cause:	CBE20 SINAMICS Link: A specific telegram word (send) is being used twice.		

A50005 (F)	COMM BOARD: Alarm 5
Message value:	%1
Message class:	Communication error to the higher-level control system (9)
Drive object:	All objects
Component:	None
Reaction:	NONE
Acknowledge:	NONE
Cause:	CBE20 SINAMICS Link: Sender not found on SINAMICS Link. Alarm value (r2124, interpret decimal): 0: synchronization to the bus clock cycle unsuccessful. 1 ... 64: address of the sender that was not found. See also: p8872 (SINAMICS Link PZD receive address)
Remedy:	CBE20 SINAMICS Link: Check the connection to the sender. Set parameters p8811, p8812[1] to identical values for all participants/nodes. Check parameter p8836 for all participants. See also: p8811 (SINAMICS Link project selection), p8812 (SINAMICS Link clock cycle settings), p8836 (SINAMICS link node address)
Reaction upon F:	Vector: NONE (OFF1, OFF2, OFF3) Infeed: NONE (OFF1, OFF2)
Acknowl. upon F:	IMMEDIATELY

A50006 (F)	COMM BOARD: Alarm 6
Message value:	Info 1: %1, Info 2: %2
Message class:	Communication error to the higher-level control system (9)
Drive object:	All objects
Component:	None
Reaction:	NONE
Acknowledge:	NONE
Cause:	CBE20 SINAMICS Link: The parameter assignment indicates that the sender and the receiver are one and the same. This is not permitted. Alarm value (r2124, interpret hexadecimal): yyyyxxxx hex: yyyy = info. 1, xxxx = info. 2 Info. 1 (decimal) = Drive object number from p8872 Info. 2 (decimal) = Index from p8872 See also: p8836 (SINAMICS link node address), p8872 (SINAMICS Link PZD receive address)
Remedy:	In the case of CBE20 SINAMICS Link: Correct the parameter assignment. All p8872[index] must be set to a value not equal to p8836.
Reaction upon F:	Vector: NONE (OFF1, OFF2, OFF3) Infeed: NONE (OFF1, OFF2)
Acknowl. upon F:	IMMEDIATELY

A50007 (F)	COMM BOARD: Alarm 7
Message value:	Info 1: %1, Info 2: %2
Message class:	Communication error to the higher-level control system (9)
Drive object:	All objects
Component:	None
Reaction:	NONE
Acknowledge:	NONE
Cause:	CBE20 SINAMICS Link: A send telegram word is greater than possible in the project. Alarm value (r2124, interpret hexadecimal): yyyyxxxx hex: yyyy = info. 1, xxxx = info. 2

A.2 List of abbreviations

Note

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS family of drives.

Abbreviation	Derivation of abbreviation	Significance
A		
A...	Alarm	Warning
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced Operator Panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American coding standard for the exchange of information
AS-i	AS-Interface (Actuator Sensor Interface)	AS-Interface (open bus system in automation technology)
ASM	Asynchronmotor	Induction motor
AVS	Active Vibration Suppression	Active load vibration damping
B		
BB	Betriebsbedingung	Operation condition
BERO	-	Contactless proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	BG-Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
C		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system
CBC	Communication Board CAN	Communication Board CAN
CBE	Communication Board Ethernet	PROFINET communication module (Ethernet)
CD	Compact Disc	Compact disc
CDS	Command Data Set	Command data set
CF Card	CompactFlash Card	CompactFlash card

Abbreviation	Derivation of abbreviation	Significance
CI	Connector Input	Connector input
CLC	Clearance Control	Clearance control
CNC	Computerized Numerical Control	Computer-supported numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output/Binector Output	Connector output/Binector output
COB-ID	CAN Object-Identification	CAN object identification
CoL	Certificate of License	Certificate of License
COM	Common contact of a change-over relay	Center contact of a changeover contact
COMM	Commissioning	Startup
CP	Communication Processor	Communication processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC	Control Unit DC
D		
DAC	Digital Analog Converter	Digital analog converter
DC	Direct Current	DC current
DCB	Drive Control Block	Drive Control Block
DCBRK	DC Brake	DC braking
DCC	Drive Control Chart	Drive Control Chart
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDC	Dynamic Drive Control	Dynamic Drive Control
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input/Digital Output	Digital input/output, bidirectional
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DMM	Double Motor Module	Double Motor Module
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual Ported Random Access Memory	Dual-Port Random Access Memory
DQ	DRIVE-CLiQ	DRIVE-CLiQ
DRAM	Dynamic Random Access Memory	Dynamic Random Access Memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
DSM	Doppelsubmodul	Double submodule
DTC	Digital Time Clock	Timer

Abbreviation	Derivation of abbreviation	Significance
E		
EASC	External Armature Short-Circuit	External armature short-circuit
EDS	Encoder Data Set	Encoder data set
EEPROM	Electrically Erasable Programmable Read-Only Memory	Electrically Erasable Programmable Read-Only-Memory
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatically sensitive devices
EIP	EtherNet/IP	EtherNet Industrial Protocol (realtime Ethernet)
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromotive Force	Electromotive force
EMK	Elektromotorische Kraft	Electromotive force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder-Data-Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering system
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Elektrostatisch gefährdete Baugruppen
ESM	Essential Service Mode	Essential service mode
ESR	Extended Stop and Retract	Extended stop and retract
F		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBLOCKS	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Fail-safe digital input
F-DO	Failsafe Digital Output	Fail-safe digital output
FEPRM	Flash-EPROM	Non-volatile write and read memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field Programmable Gate Array
FW	Firmware	Firmware
G		
GB	Gigabyte	Gigabyte
GC	Global Control	Global control telegram (broadcast telegram)

Abbreviation	Derivation of abbreviation	Significance
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as M)
GSD	Gerätstammdatei	Generic Station Description: Describes the features of a PROFIBUS slave
GSV	Gate Supply Voltage	Gate supply voltage
GUID	Globally Unique Identifier	Globally Unique Identifier
H		
HF	High frequency	High frequency
HFD	Hochfrequenzdrossel	Radio frequency reactor
HLA	Hydraulic Linear Actuator	Hydraulic linear actuator
HLG	Hochlaufgeber	Ramp-function generator
HM	Hydraulic Module	Hydraulic Module
HMI	Human Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with high interference threshold
HW	Hardware	Hardware
I		
i. V.	In Vorbereitung	Under development: This property is currently not available
I/O	Input/Output	Input/output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Startup
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor power switch with integrated control electrode
IL	Impulslöschung	Pulse suppression
IP	Internet Protocol	Internet protocol
IPO	Interpolator	Interpolator
IT	Isolé Terre	Non-grounded three-phase line supply
IVP	Internal Voltage Protection	Internal voltage protection
J		
JOG	Jogging	Jogging
K		
KDV	Kreuzweiser Datenvergleich	Data cross-check
KHP	Know-how protection	Know-how protection
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY84	-	Temperature sensor

Abbreviation	Derivation of abbreviation	Significance
L		
L	-	Symbol for inductance
LED	Light Emitting Diode	Light emitting diode
LIN	Linearmotor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least significant bit
LSC	Line-Side Converter	Line-side converter
LSS	Line-Side Switch	Line-side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
M		
M	-	Symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDI	Manual Data Input	Manual data input
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-readable product code
MM	Motor Module	Motor Module
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
N		
N. C.	Not Connected	Not connected
N...	No Report	No report or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization association in USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NTP	Network Time Protocol	Standard for synchronization of the time of day
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory

Abbreviation	Derivation of abbreviation	Significance
O		
OA	Open Architecture	Software component which provides additional functions for the SINAMICS drive system
OAIF	Open Architecture Interface	Version of the SINAMICS firmware as of which the OA-application can be used
OASP	Open Architecture Support Package	Extends the commissioning tool to include the corresponding OA-application
OC	Operating Condition	Operation condition
OCC	One Cable Connection	One-cable technology
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Bus connector for fiber-optic cable
OMI	Option Module Interface	Option Module Interface
P		
p...	-	Adjustable parameters
P1	Processor 1	Processor 1
P2	Processor 2	Processor 2
PB	PROFIBUS	PROFIBUS
PcCtrl	PC Control	Master control
PD	PROFIdrive	PROFIdrive
PDC	Precision Drive Control	Precision Drive Control
PDS	Power unit Data Set	Power unit data set
PDS	Power Drive System	Drive system
PE	Protective Earth	Protective ground
PELV	Protective Extra Low Voltage	Safety extra-low voltage
PFH	Probability of dangerous failure per hour	Probability of dangerous failure per hour
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logical Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PM	Power Module	Power Module
PMI	Power Module Interface	Power Module Interface
PMSM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point to Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PT1000	-	Temperature sensor
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point To Point	Point-to-point

Abbreviation	Derivation of abbreviation	Significance
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
Q		
R		
r...	-	Display parameters (read only)
RAM	Random Access Memory	Memory for reading and writing
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
REL	Reluctance motor textile	Reluctance motor textile
RESM	Reluctance synchronous motor	Synchronous reluctance motor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RLM	Renewable Line Module	Renewable Line Module
RO	Read Only	Read only
ROM	Read-Only Memory	Read-only memory
RPDO	Receive Process Data Object	Receive Process Data Object
RS232	Recommended Standard 232	Interface standard for a cable-connected serial data transmission between a transmitter and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of transmitters and receivers, also known as EIA485)
RTC	Real Time Clock	Real-time clock
RZA	Raumzeigerapproximation	Space-vector approximation
S		
S1	-	Continuous duty
S3	-	Intermittent duty
SAM	Safe Acceleration Monitor	Safe acceleration monitoring
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	Safe Brake Ramp	Safe brake ramp monitoring
SBT	Safe Brake Test	Safe brake test
SCA	Safe Cam	Safe cam
SCC	Safety Control Channel	Safety Control Channel
SCSE	Single Channel Safety Encoder	Single-channel safety encoder
SD Card	SecureDigital Card	Secure digital memory card
SDC	Standard Drive Control	Standard Drive Control
SDI	Safe Direction	Safe motion direction
SE	Sicherer Software-Endschalter	Safe software limit switch

Abbreviation	Derivation of abbreviation	Significance
SESM	Separately-excited synchronous motor	Separately excited synchronous motor
SG	Sicher reduzierte Geschwindigkeit	Safely-limited speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe stop
SI	Safety Integrated	Safety Integrated
SIC	Safety Info Channel	Safety Info Channel
SIL	Safety Integrity Level	Safety integrity level
SITOP	-	Siemens power supply system
SLA	Safely-Limited Acceleration	Safety limited acceleration
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely-limited position
SLS	Safely-Limited Speed	Safely-limited speed
SLVC	Sensorless Vector Control	Sensorless vector control
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SMI	SINAMICS Sensor Module Integrated	SINAMICS Sensor Module Integrated
SMM	Single Motor Module	Single Motor Module
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SP	Safe Position	Safe position
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial peripheral interface
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe Stop 1 (time-monitored, ramp-monitored)
SS1E	Safe Stop 1 External	Safe Stop 1 with external stop
SS2	Safe Stop 2	Safe Stop 2
SS2E	Safe Stop 2 External	Safe Stop 2 with external stop
SSI	Synchronous Serial Interface	Synchronous serial interface
SSL	Secure Sockets Layer	Encryption protocol for secure data transfer (new TLS)
SSM	Safe Speed Monitor	Safe feedback from speed monitor
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
T		
TB	Terminal Board	Terminal Board
TEC	Technology Extension	Software component which is installed as an additional technology package and which expands the functionality of SINAMICS (previously OA-application)

Abbreviation	Derivation of abbreviation	Significance
TIA	Totally Integrated Automation	Totally Integrated Automation
TLS	Transport Layer Security	Encryption protocol for secure data transfer (previously SSL)
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase line supply
Tn	-	Integral time
TPDO	Transmit Process Data Object	Transmit Process Data Object
TSN	Time-Sensitive Networking	Time-Sensitive Networking
TT	Terre Terre	Grounded three-phase line supply
TTL	Transistor-Transistor-Logic	Transistor-transistor logic
Tv	-	Rate time
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal time coordinated
V		
VC	Vector Control	Vector control
Vdc	-	DC-link voltage
VdcN	-	Partial DC-link voltage negative
VdcP	-	Partial DC-link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
Vpp	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
W		
WEA	Wiedereinschaltautomatik	Automatic restart
WZM	Werkzeugmaschine	Machine tool
X		
XML	Extensible Markup Language	Extensible markup language (standard language for Web publishing and document management)
Y		
Z		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word
